

# **Model 2: Local model of equipment hatch**

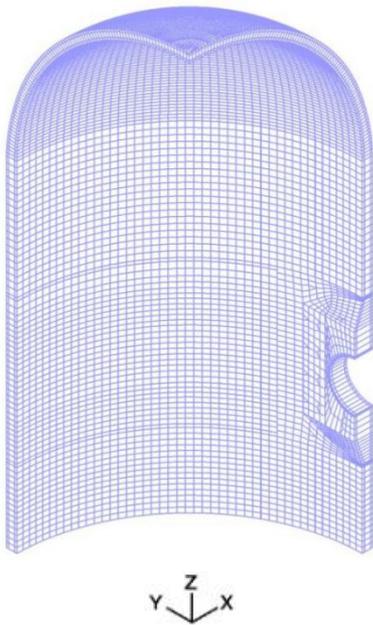

Ludwig Bahr (GRS)

## Model 2 - Overview

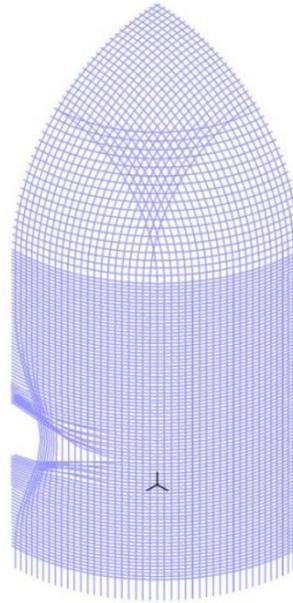

- Simulation performed with ADINA 8.7.1
  
- Model developed within an internal research project
  - 90 degrees of circumference including half of E/H
  - Tendons and rebars rigidly tied to concrete volume elements
  - Tendons A and B combined to one line of truss elements
  - Multiple rebars/stirrups combined to one line of truss elements
  - Liner rigidly tied to inner surface of concrete volume elements

# Finite element model

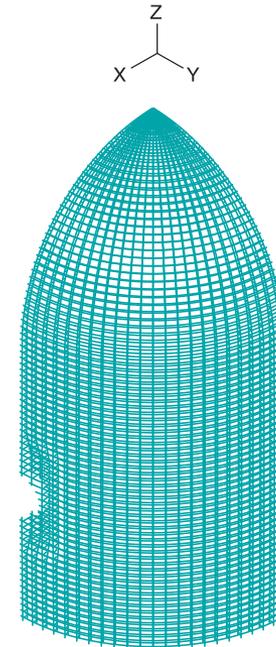

Concrete  
(volume el.)

Tendons  
(truss el.  
tied to vol. el.)

Rebars  
(truss el.  
tied to vol. el.)

# Finite element model

## Materials:

- bilinear stress-strain relation for rebar, tendon steel
- multi-linear stress-strain relation for liner steel
- ADINA concrete model (smeared crack, strain softening)
