Presenters

- **Alexandre Y. Fong**, M.Sc., MBA, C.Eng. VP Sales and Marketing, Optronic Laboratories, Inc.
- **Jerry Simmons**, Ph.D., Deputy Director for Energy Sciences of the Center for Physical, Chemical, and Nano-Sciences, Sandia National Laboratories
- **Ghassan Jabbour**, Ph.D., Professor and Director, Optoelectronic Materials and Devices, Arizona State University
- **John Ekis**, Director, Sales, Lamina Ceramics

Key SSL Benefits

- **Basis of solid-state lighting, LEDs developed in US by N. Holonyak in 1962 at GE**
- **Potentially extremely energy efficient, ~22% electricity used in lighting. Smart LEDs could reduce the nation's total electricity use by 10%, at a savings of ~\$30B/year**
- **Good for the environment – longer lifetimes (up to 10 years), less material, reduced carbon emissions, and no dangerous mercury (like in fluorescents)**
- **Unparalleled color-changing properties and controllability mean a wide range of applications such as architectural lighting or entertainment lighting, flat panel displays [30%]**
- **Optics and photonics are enabling technologies which are the basis for this technology**

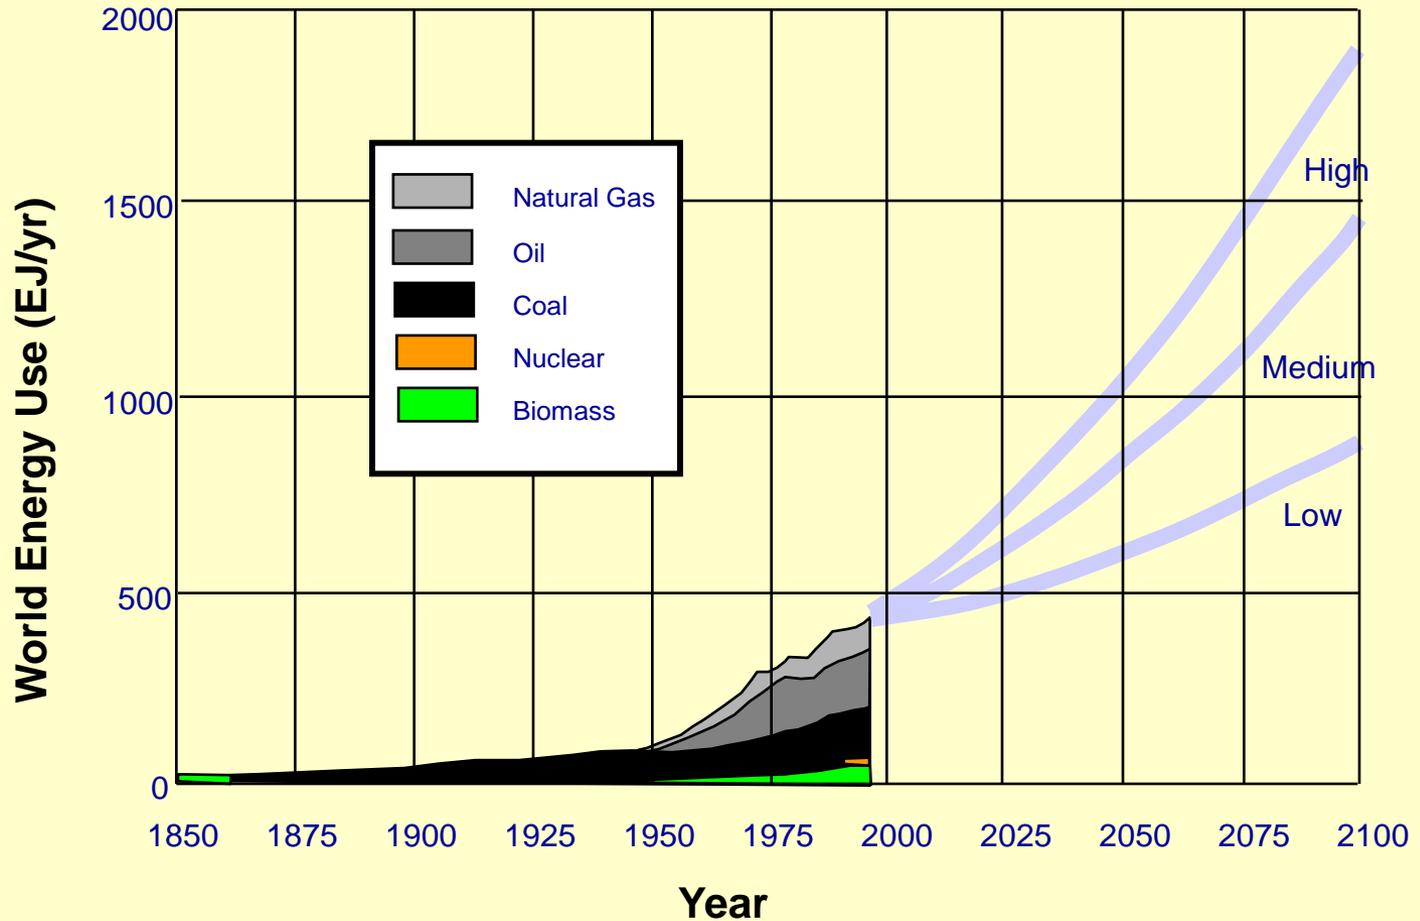

Role of Optics and Photonics

- Optics and photonics is the science behind SSL
- “Making, managing and measuring light”: Semiconductor development, lens design and test and measurement of light
- Education in math and physical sciences are fundamental
- New advancements in SSL will depend upon our knowledge of optics and photonics

Energy

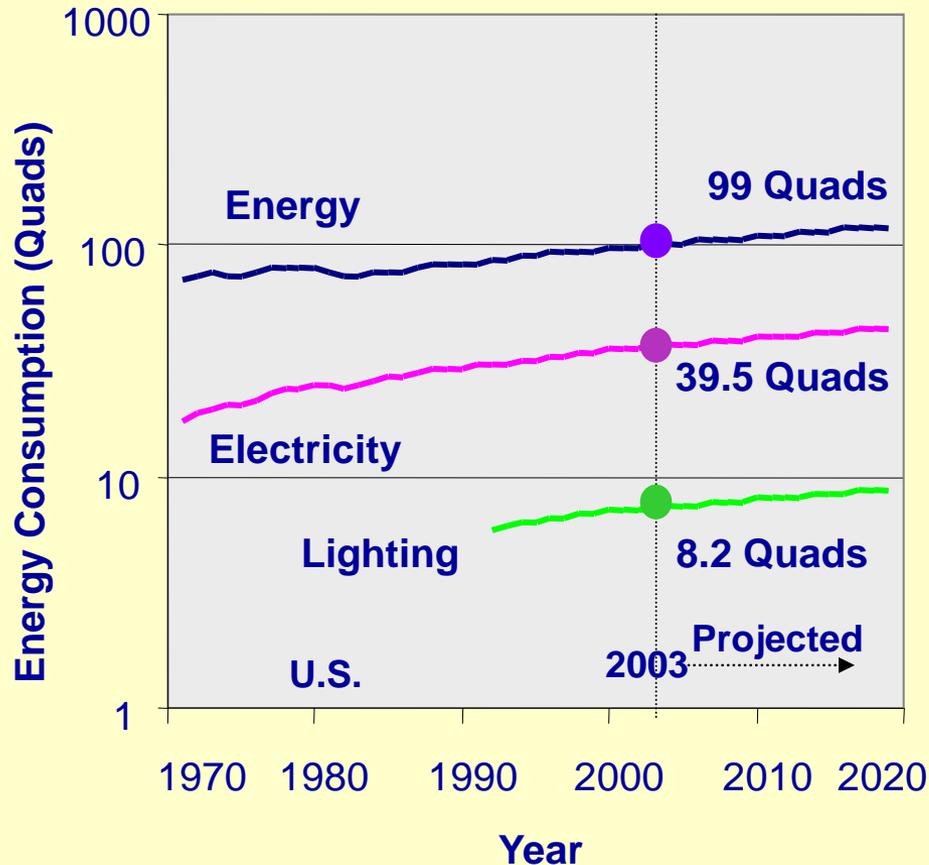

Jerry Simmons
Sandia National Laboratories

Energy security will be a major challenge of the 21st century

Lighting is a large fraction of energy consumption and is low efficiency

~22% of electricity consumption is for general illumination

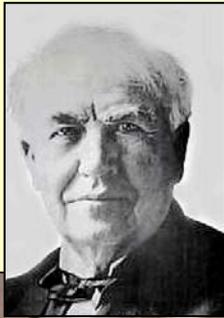

Efficiencies of energy technologies in buildings:

- Heating: 70 - 80%
- Elect. motors: 85 - 95%
- Fluorescents: **25%**
- Incandescents: **5%**

Lighting is a highly attractive target for reducing energy consumption.

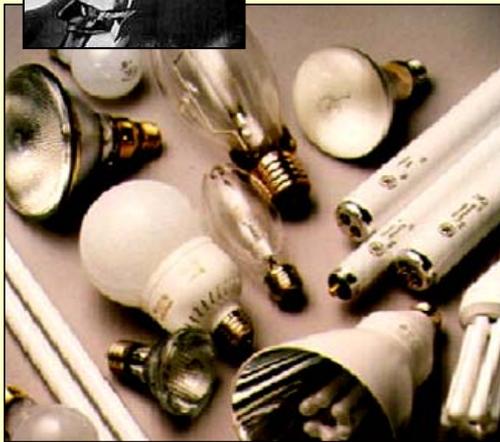

Conventional lighting is the last technology that still uses vacuum tubes

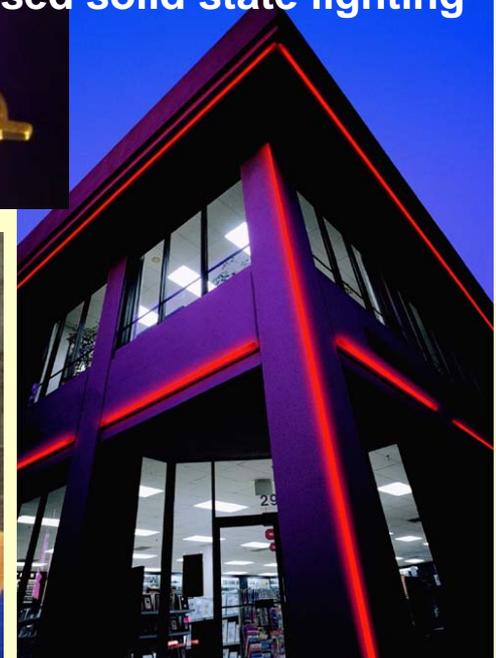

Thomas Edison

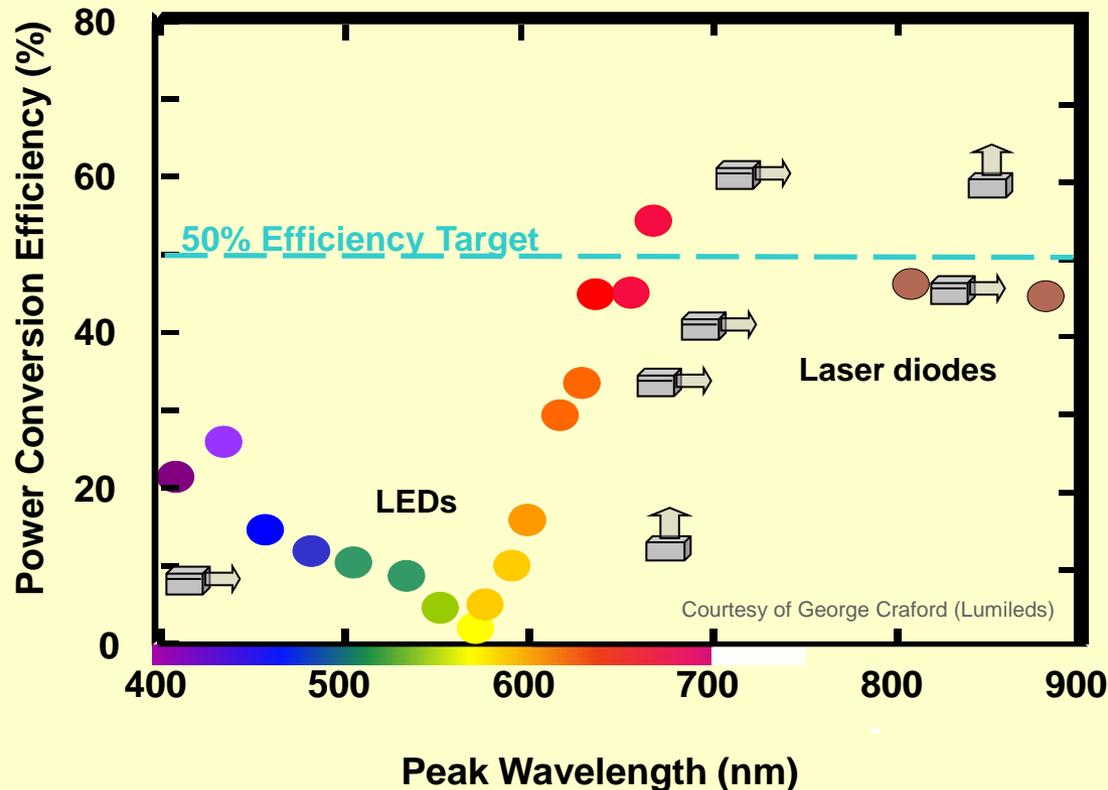

New semiconductor based solid state lighting

Old vacuum-tube based lighting

LEDs have the potential to exceed 50% efficiency throughout the visible spectrum

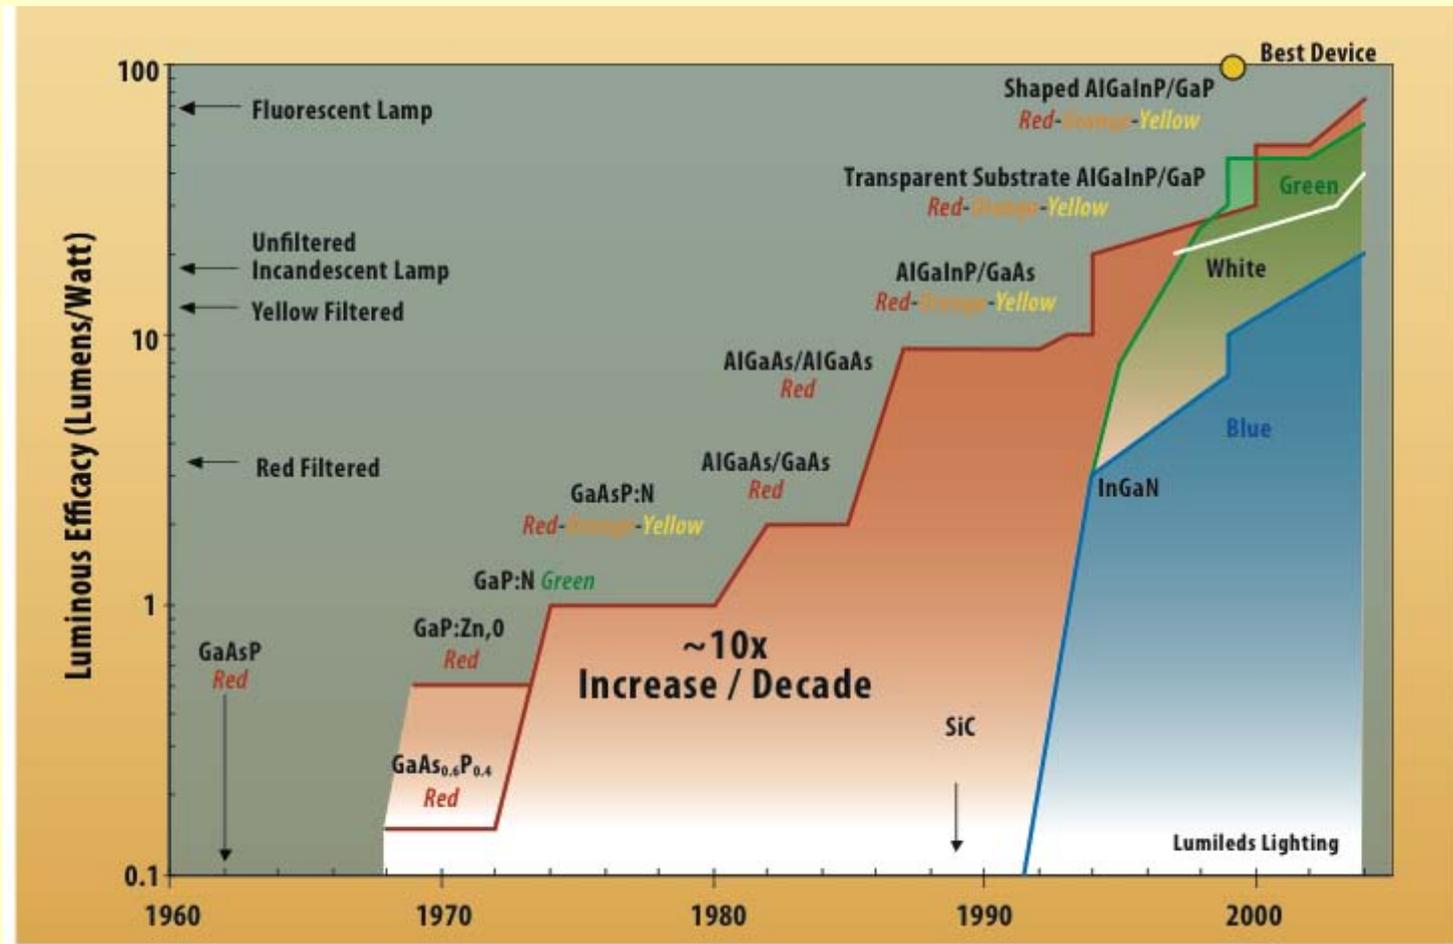

Lasers and LEDs have already achieved >50% efficiency in the red and infrared

Consensus among experts is that this can be done in the visible too.

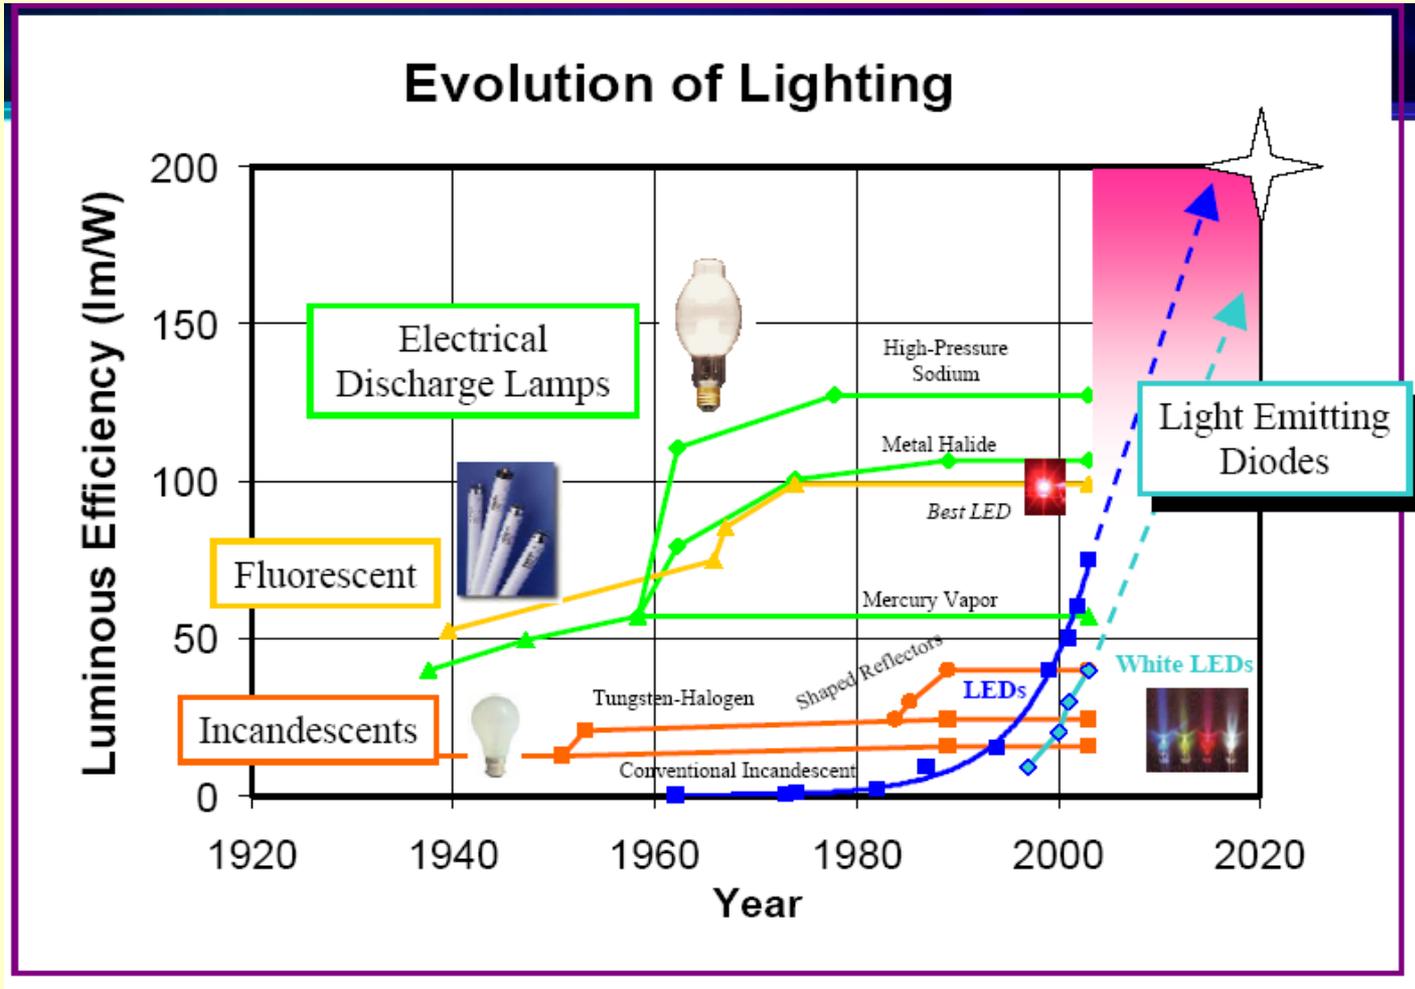

Energy Efficiency: Solid-state lighting is potentially **10X** and **2X** more efficient than incandescent and fluorescent lamps, respectively.

LEDs Have Been Increasing in Efficiency (and Dropping in Cost) Following a Moore's Law

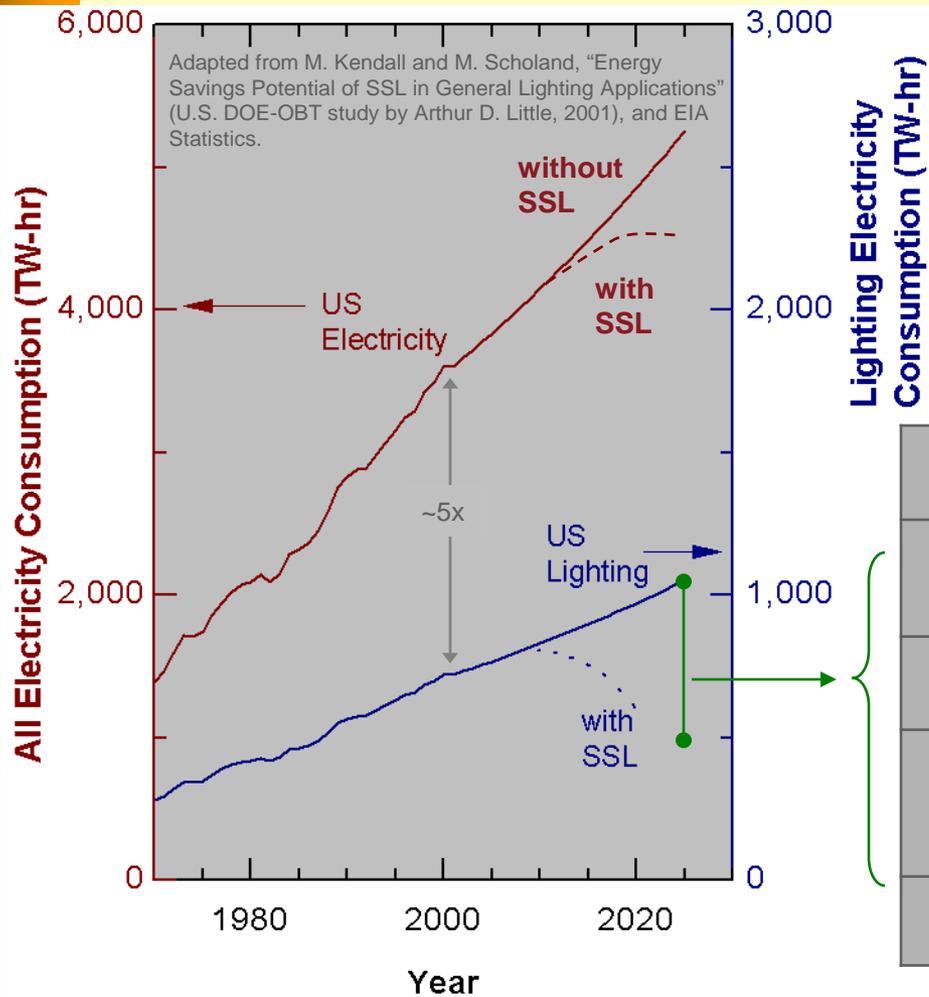

RED: lm/W has improved at 10X/decade, cost has decreased at 10X/decade.

Evolution of Lighting

SSL Laboratory and Commercial Curves, revised September 2004

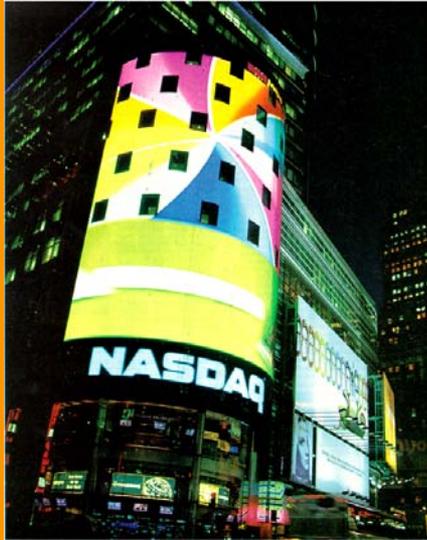

Potential Pay-offs of 50% Efficient SSL are Huge

- Assuming major government investment, we expect, by 2025, to:
 - decrease electricity consumed by lighting by 50%
 - decrease total electricity consumption by 10%

Projected Year 2025 Savings	US	World
Electricity use at site (billion kWh)	500/year	1,700/year
\$ spent on Electricity per year	25B	105B
Electricity generating capacity (GW)	50	~175
Carbon emissions (Mtons)	50	~175

Solid State Lighting is *The Second Semiconductor Revolution*

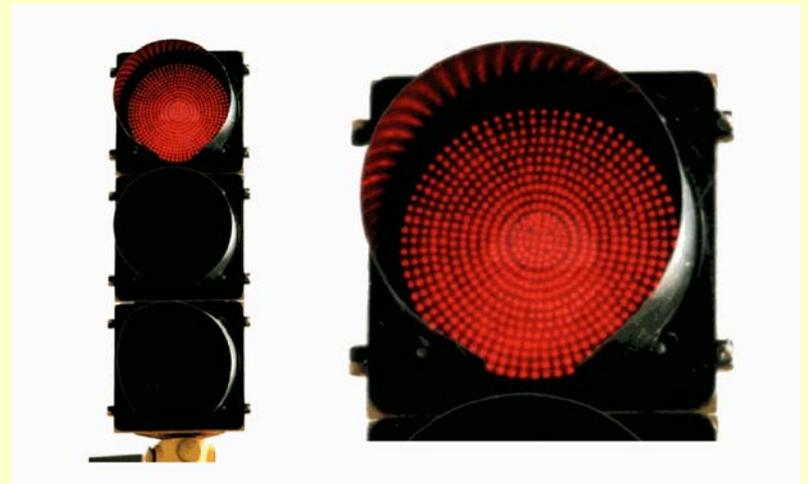

Disruptive Technology: SSL will have huge advantages.

- Compact
- Low Heat
- Shock resistant
- Long lifetime (100,000 hours)
- Easily integrated w/ intelligence
- ***Exquisite control over spectral distribution***

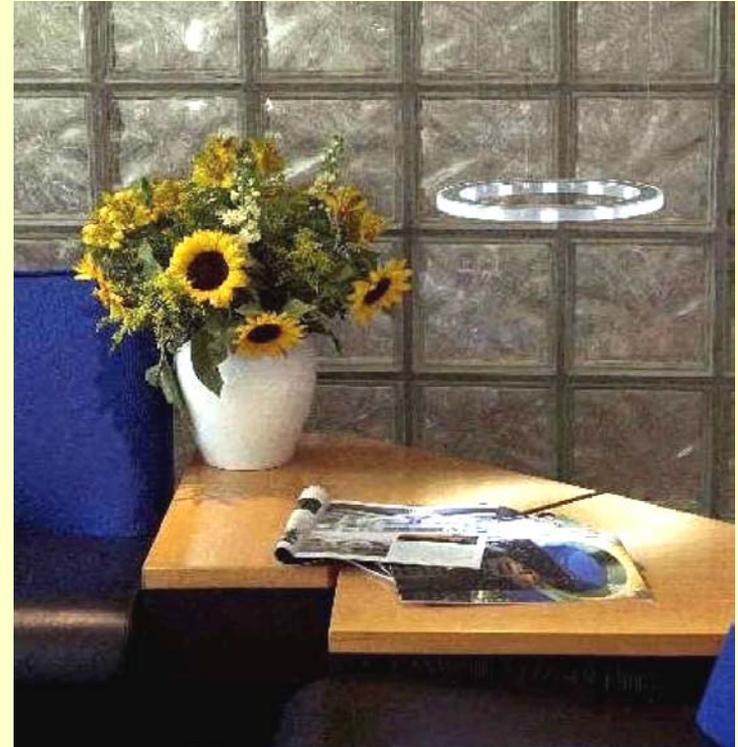

LEDs Are Already Superior for Monochrome Applications

- Red LEDs are now 10X more efficient than red- filtered incandescents
- Today, ~1/2 of US traffic lights are LED-based
- Payback time for LED traffic lights is ~ 1 year
- After that the cost savings are ***\$1,000/year per intersection***

The Future: complete replacement by SSL for general illumination

This will be harder to accomplish...

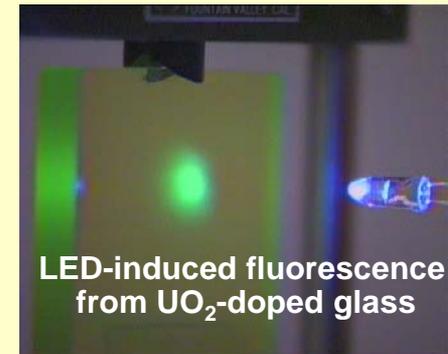

Materials developed for SSL are becoming important for National Security

The large energy band-gaps of GaN-based materials are uniquely suited to:

- **semiconductor UV optoelectronics**
 - *chem-bio detectors*
 - *water purification*
 - *surface decontamination*
 - *solar blind missile plume detectors*
- **high-power, high-frequency electronics**
 - *THz electronics*
 - *High frequency radar*

Predator UAV

LED-induced fluorescence from UO₂-doped glass

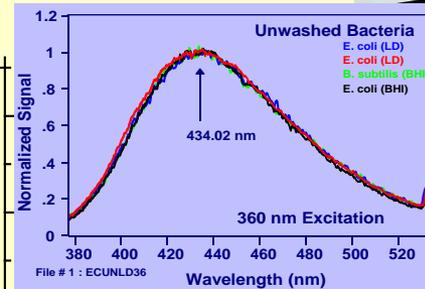

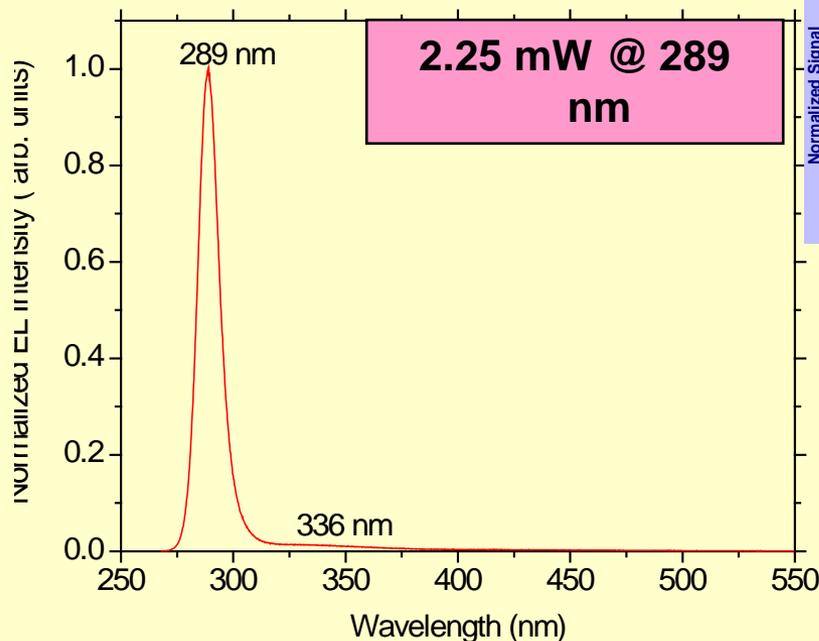

Radar Antenna Assembly

Detection of Biological Weapons is an emerging application for UV LEDs

DARPA has had several programs

- Compact, low-cost, fluorescence-based anthrax detector

Bacteria fluorescence spectrum

Micro-UAV application

Color Rendering Index

“The color rendering index (CRI), is a measure of the ability of a light source to reproduce the colors of various objects being lit by the source (100 is the best CRI).”

Lower CRI leads to faded (dead look) images!

<i>Light source</i>	<i>Color rendering index</i>
Sunlight	100
Quartz halogen W filament light	100
W filament incandescent light	100
Fluorescent light	60 – 85
Phosphor-based white LEDs/OLEDs	60 – 90
Trichromatic white light LEDs/OLEDs	60 – 90
Hg vapor light coated with phosphor	50
Na vapor light	40
Hg vapor light	20
Dichromatic white light LEDs	10 – 40

National Lighting Product Information Program (NLPIP) survey on the importance of lamp color and efficacy (2004)

<http://www.lrc.rpi.edu/programs/nlpiplightinganswers/lightsources/importance.asp>

F. Schubert LED 2001 (updated by G. E. Jabbour)

Why LEDs/OLEDs for Solid State Lighting?

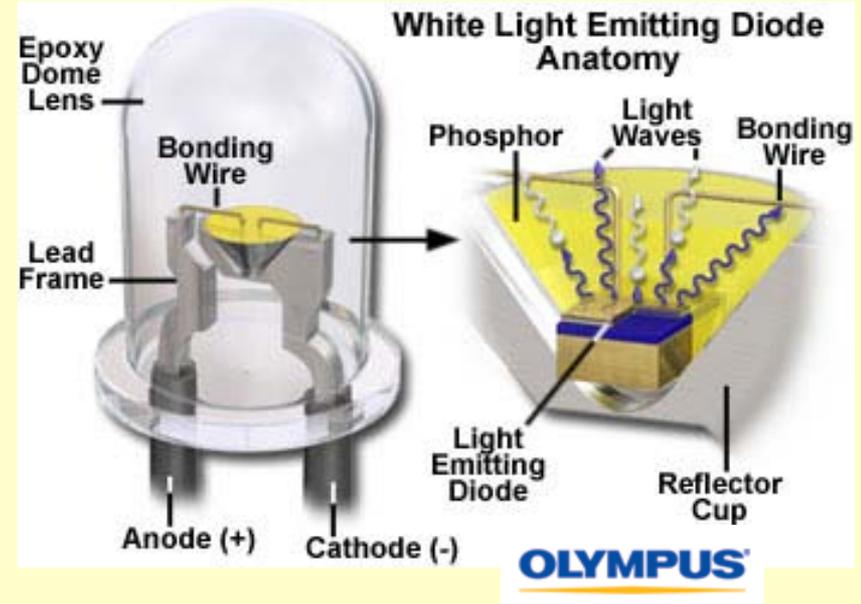

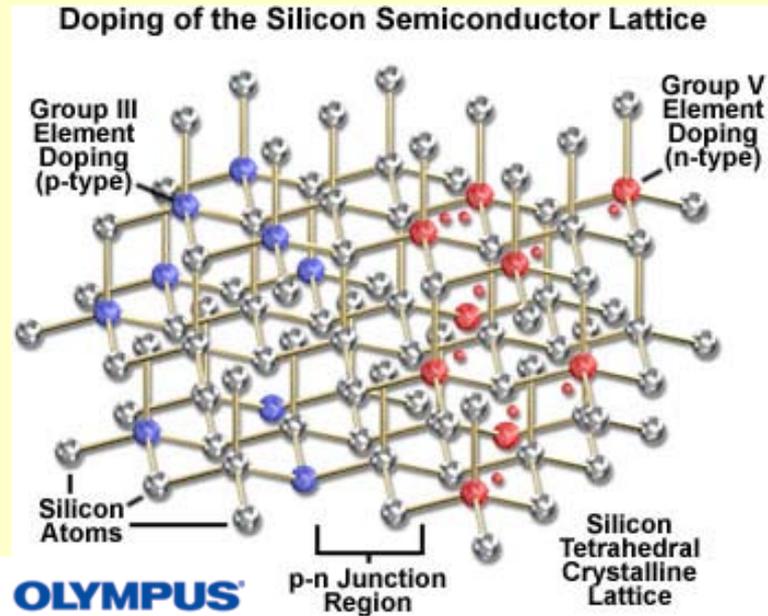

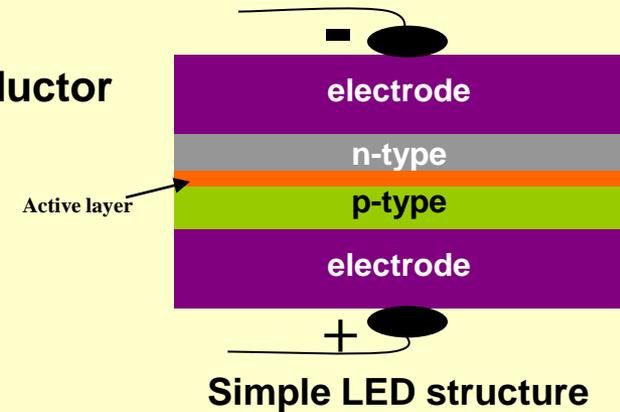

LEDs/OLEDs offer an unprecedented route not only to high CRI, but also energy efficient solid state lighting sources that are extremely important for various security and economical reasons. LEDs/OLEDs also offer:

- Light weight (a solidier normally carries more than 100 lbs!) lights
- Rugged lights
- Low Power consumption
- UV-Visible-IR capable
- Low fabrication costs (OLEDs) including printing techniques can be used
- Flexible lights and displays (OLEDs)

What is an LED?

A simple LED is a single crystal sandwich of semiconductor layers:

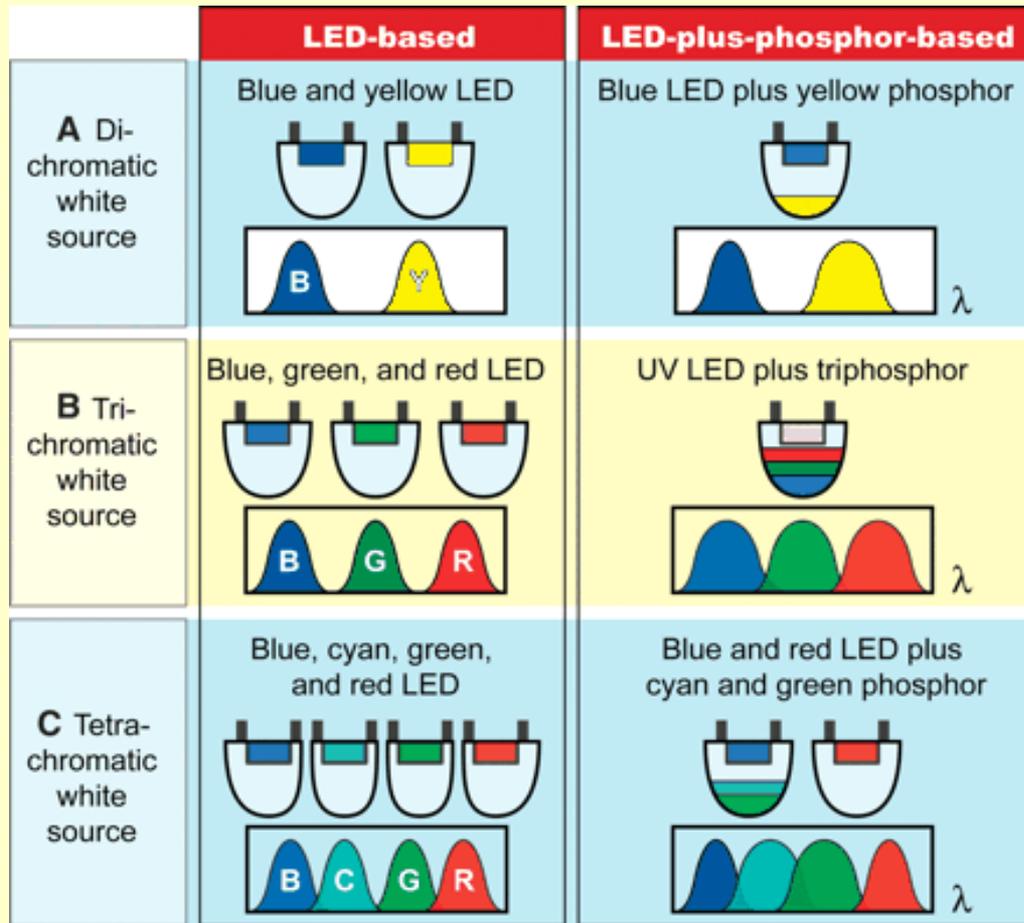

- Negative type layer (n-type to carry electrons)
- Positive type layer (p-type to carry holes)
- Active layer where electrons and holes recombine (annihilate) to produce a photon

Atoms must be placed within certain order with respect to each other. This means special fabrication techniques (e.g. Molecular Beam Epitaxy, Chemical Vapor Deposition).

How to Make White LEDs?

Combine various monochromes!

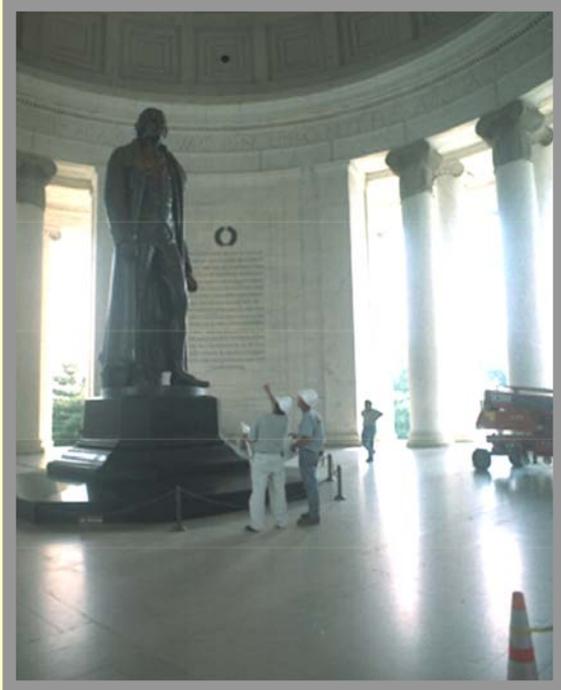

E. F. Schubert et al., Science 308, 1274 -1278 (2005)

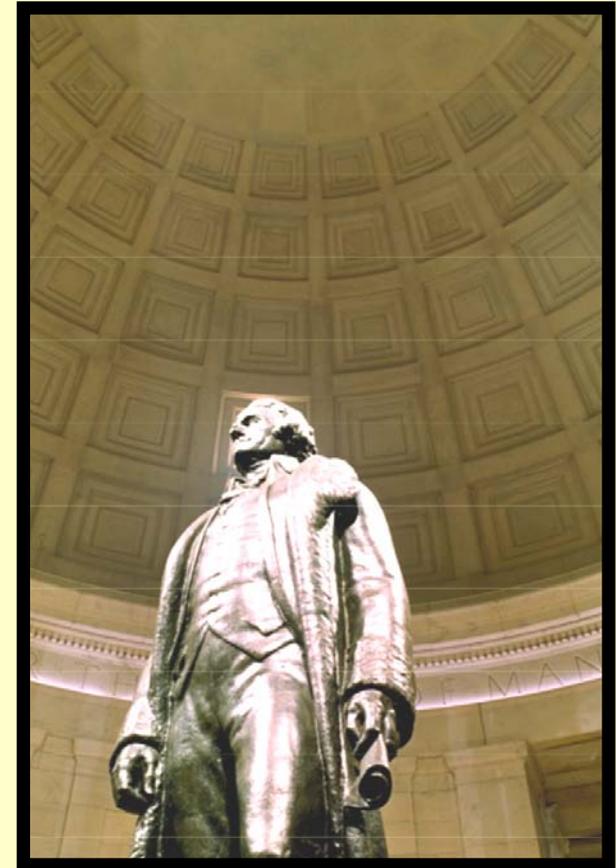

Jefferson Memorial

LED Lighting!

NO lights were used in interior dome (difficulty maintaining them, due to the > 50 ft height!).

Jefferson's quote lighted with 17,000 light emitting diodes
(750 linear feet of LED's)

From **SYLVANIA**

The Largest LED Display in the World

(Fremont Street Mall in Las Vegas, Nevada-USA)

- **1,500 ft long**
- **12.5 million LEDs**

In addition to security, lighting and displays, some LED applications are:

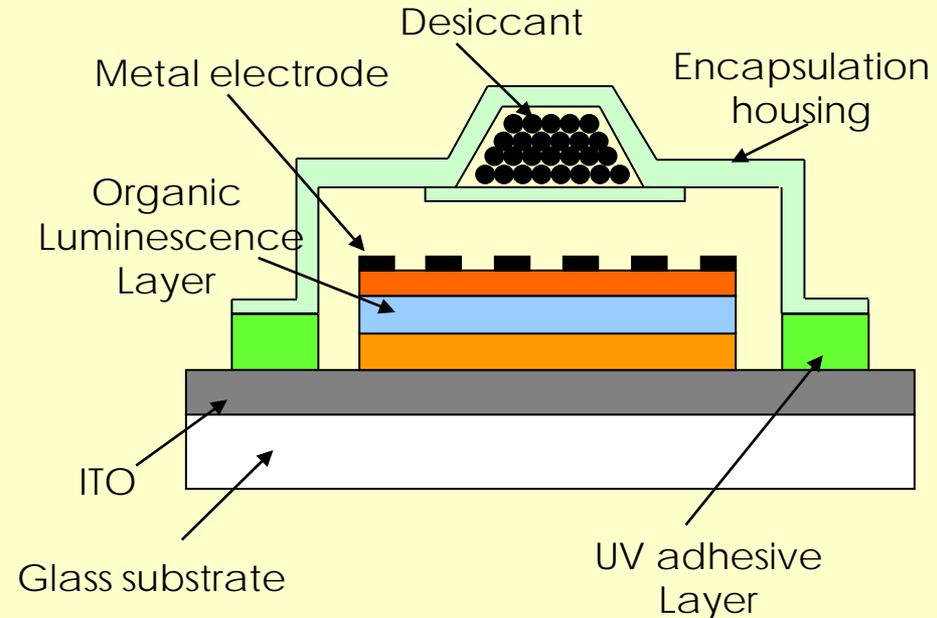

- **Telecommunications**
- **Medical imaging and therapy**
- **Armed Forces (vehicles and outfits)**
- **Plant growth**
- **Architecture**
- **Optical measurements**
- **Airports**
- **Traffic signs and law enforcement vehicles**

What is an OLED?

A simple OLED is made of:

- p-type organic layer
- light emitting layer
- n-type organic layer

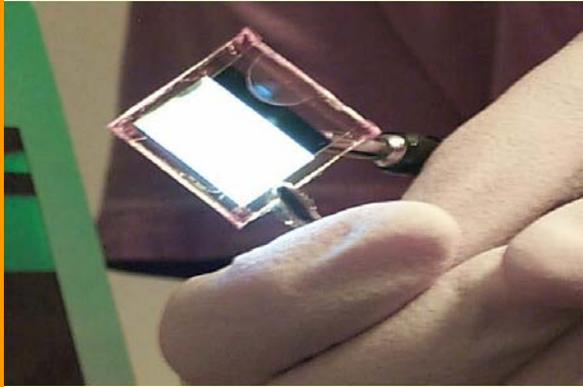

ALL layers are amorphous (no order is required for molecules!)

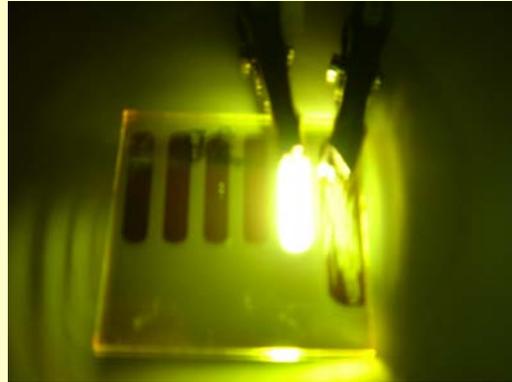

- **OLEDs can be fabricated with low cost techniques including: Inkjet and roll-to-roll printing tools!**
- **Large area DIFFUSE lights!**
- **White OLEDs can be obtained by either multilayer structure, or single layer based on nano-materials (recent progress)**

OLEDs printed on textile

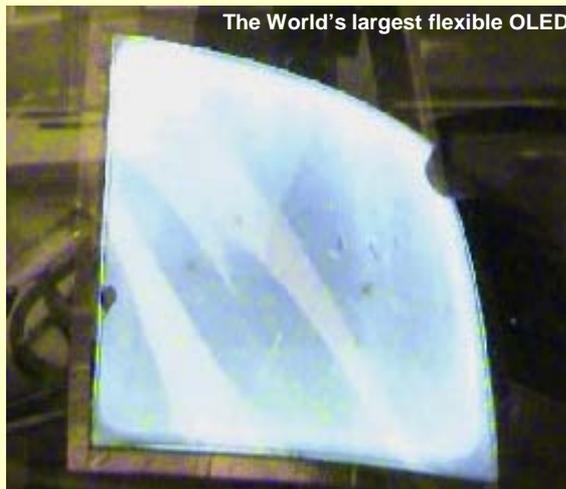

Transparent OLEDs!

Recent Progress in White OLEDs

The World best voltage independent white OLED developed recently:

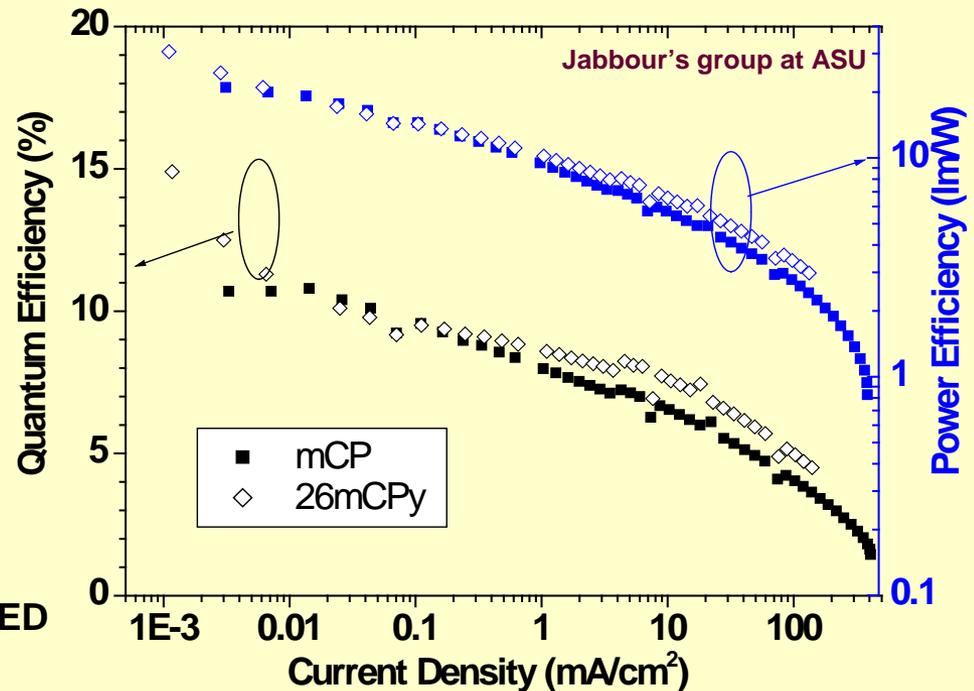

- Luminous efficiency: 8 lm/W at about 900 cd/m²
- Required for SSL application: at least 45 lm/W at 900 cd/m²

white 5a.wmv

Jabbour's group at ASU

R&D Challenges to Achieving 50% Energy Efficient SSL

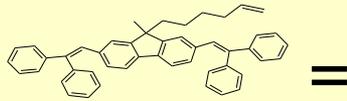

- Higher performance, better quality semiconductor crystal materials, especially green
- Higher performance, better quality organic materials
- New techniques and designs for light extraction (getting the light out of the LED) -- e.g. photonic crystals.
- More efficient phosphors and hybrids -- e.g. quantum dots.
- Higher performance packaging and encapsulation materials

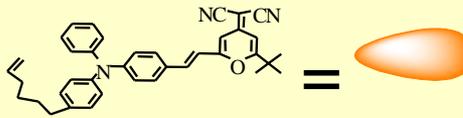

Nanoscience will help to overcome these challenges

R&D Challenges continued

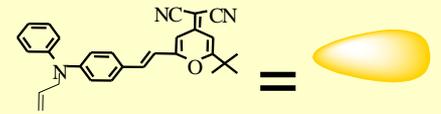

Novel Organic/Inorganic Nano SSL Materials

white

Collaboration with Nitto Denko-San Diego Division

Nanoscience & Nanotechnology will play a critical role in SSL

To achieve 50% efficiency, we need to understand and control the complex interplay of:

- *charge carrier transport at the nanoscale*
- *quantum confinement*
- *radiative & non-radiative recombination*
- *point & extended defects*
- *how molecular structure controls function*

The obstacles to achieving 50% energy efficiency SSL are largely ***nanoscience problems.***

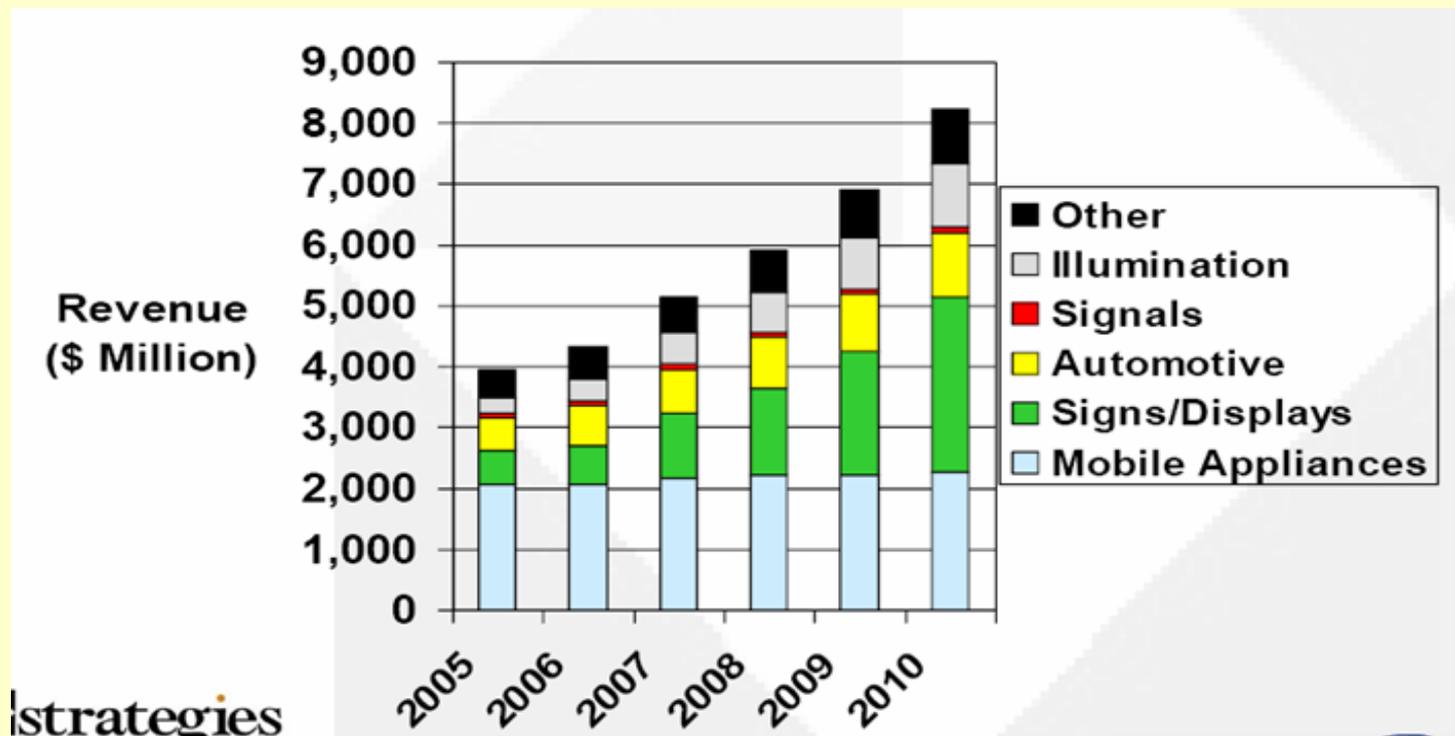

SSL Markets and the Industrial Perspective

John J. Ekis
Lamina Ceramics

Industrial Perspective

- Markets, Economic Drivers and Growth
- Global Competition
- Application Gallery
- Technology Demonstration

HB LED Summary Forecast By Application 2004-2010 (\$ Million) †

† Courtesy Robert V. Steele, Strategies Unlimited

Growth in SSL[†]

- High-brightness LED market has grown from \$300 million in 1997 to \$1.8 billion in 2002.
- Growth has continued by 50% through 2004 to \$3.7 billion.
- Forecast for the HB-LED market to grow to > \$5 billion by 2007 and >\$8 billion in 2010.

Market Drivers ▶ Input for Roadmaps

Technology Roadmaps for LEDs

- End User Driven
 - New Possibilities
 - Design, branding, form factor, digital control, saturated colors
 - Reduced Cost of Ownership
 - Longer life, energy efficiency, reliability, lumen maintenance, safety
 - Environmental Impact
 - Mercury, lead, energy efficiency

Market Drivers ► Input for Roadmaps

Technology Roadmaps for LEDs

- Industry Initiatives
 - Next Generation Lighting Industry Alliance
www.nema.org/index_nema.cfm/640/
 - Alliance for Solid State Illumination Systems & Technologies
www.lrc.rpi.edu/programs/solidstate/assist/ASSISTHome.htm
 - European Photonics Industry Consortium:
www.epic-assoc.com

Market Drivers ▶ Input for Roadmaps

Technology Roadmaps for LEDs

- Government Initiatives
 - US (www.netl.doe.gov/ssl), Japan, Taiwan, Korea, China
 - Objectives
 - Reduce
 - CO2 emissions from energy generation
 - Need for new power plants
 - Dependence on un-renewable fuels
 - Environmental impact – mercury, lead

Worldwide Competition

- Main production and consumption in US, Europe, Japan, Taiwan, South Korea, China and Southeast Asia
- Virtually all HB LEDs packaged in Asia
- Initial investment in 2004 from China in National SSL program of RMB 140 m (\$17 m) from central government, involving 15 research institutions and more than 50 enterprises – Target to replace 40% of incandescent lighting with SSL

Times Square Ball to be Lit with LEDs

- The 1,070 pound geodesic orb, six feet in diameter, currently contains 600 clear and colored high-intensity halogen bulbs and 96 halogen strobe lights
- By New Year's Eve 2006/07 celebration, Philips Electronics will outfit the ball with an interior of more efficient LEDs.
- By 2007/08, entire sphere will be redesigned and completely illuminated by LEDs.

SERIOUS WORK DESERVES SERIOUS LIGHTING

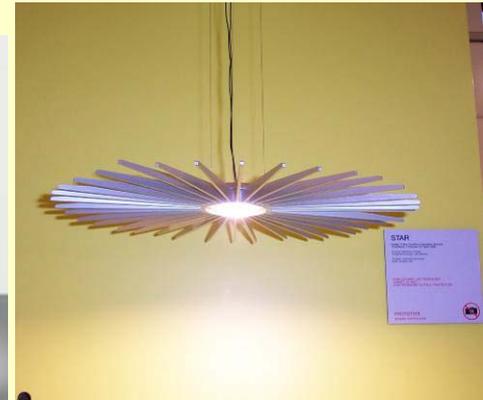

What is the annual investment in an employee whose work area lies under a shelf or cabinet? It varies, of course. But it's thousands more than lighting with a \$26.99 built-in-box can justify!

Little Inch Xtra: greater payback on task lighting investment

- 4 lamping options: LED, fluorescent, xenon, halogen
- optical systems for superior control of light over entire work surface
- 1000-lumen lighting (equal levels with LEDs)
- minimal heat transfer
- lamp life of 2,000... 10,000... 20,000... or 50,000 hours
- warranty: all components except lamps and transformers... 10 year warranty on LEDs

For *General Illumination*, replacing conventional lighting will be harder

QuickTime™ and a
TIFF (LZW) decompressor
are needed to see this picture.

Technology breakthroughs must continue to take place for white light SSL to compete with conventional lighting

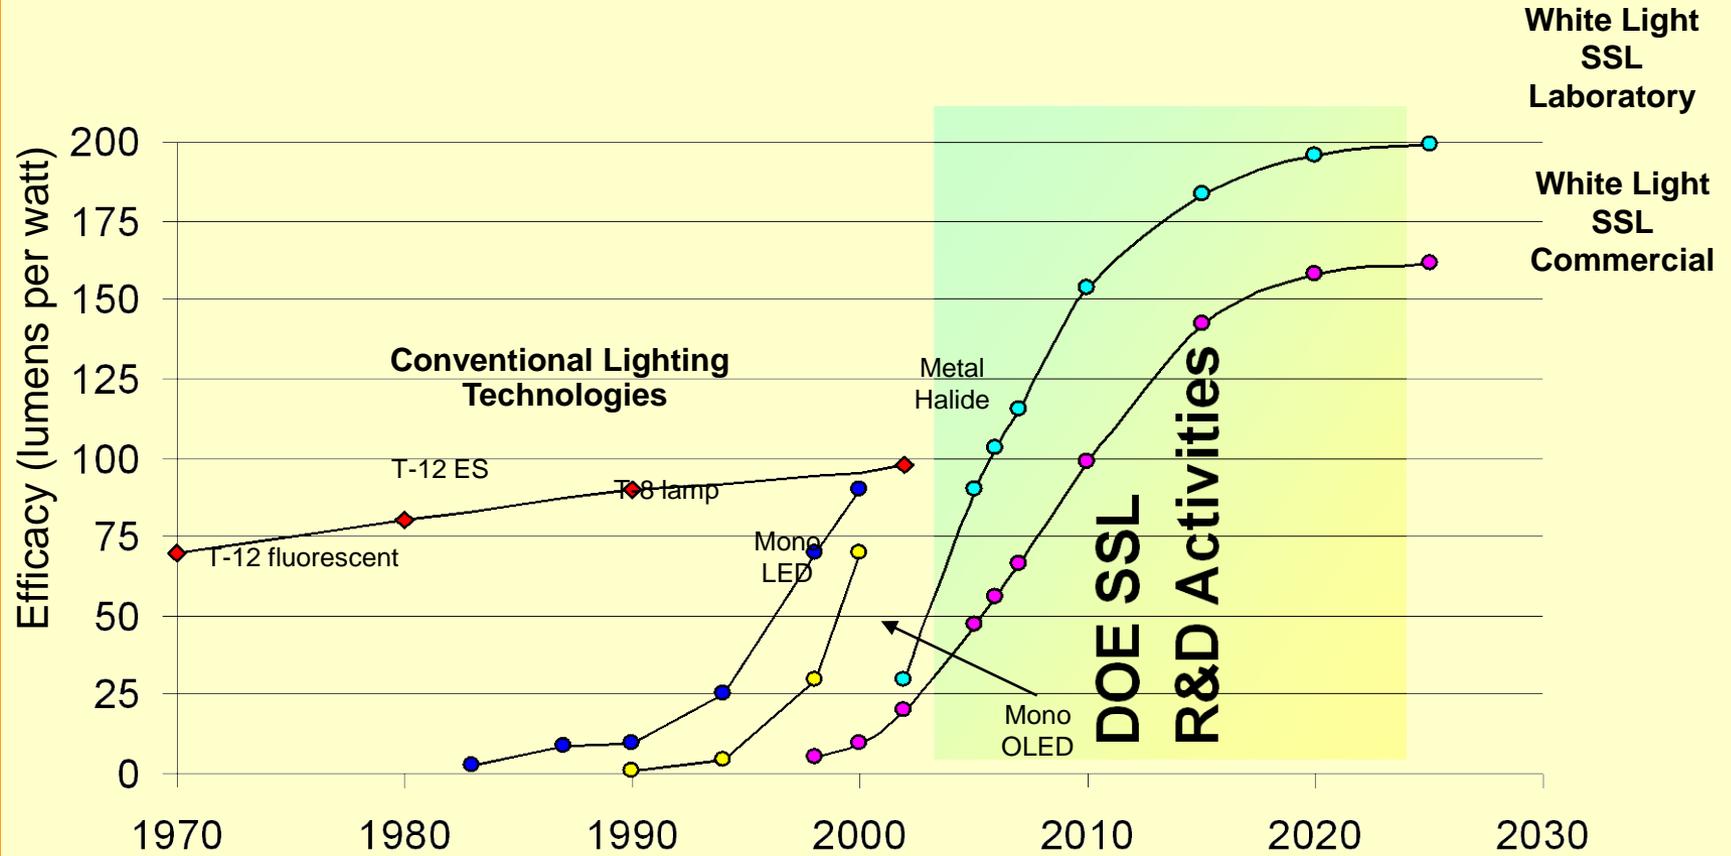

DOE/Office of Energy Efficiency and Renewable Energy has an SSL program

DOE/EERE Solid-State Lighting Program Goal

By 2025, develop advanced solid state lighting technologies that, compared to conventional lighting technologies, are much more energy efficient, longer lasting, and cost-competitive, by targeting a product system efficiency of 50 percent with lighting that accurately reproduces the sunlight spectrum.

<http://www.netl.doe.gov/ssl>

Accelerated R&D for White Light SSL

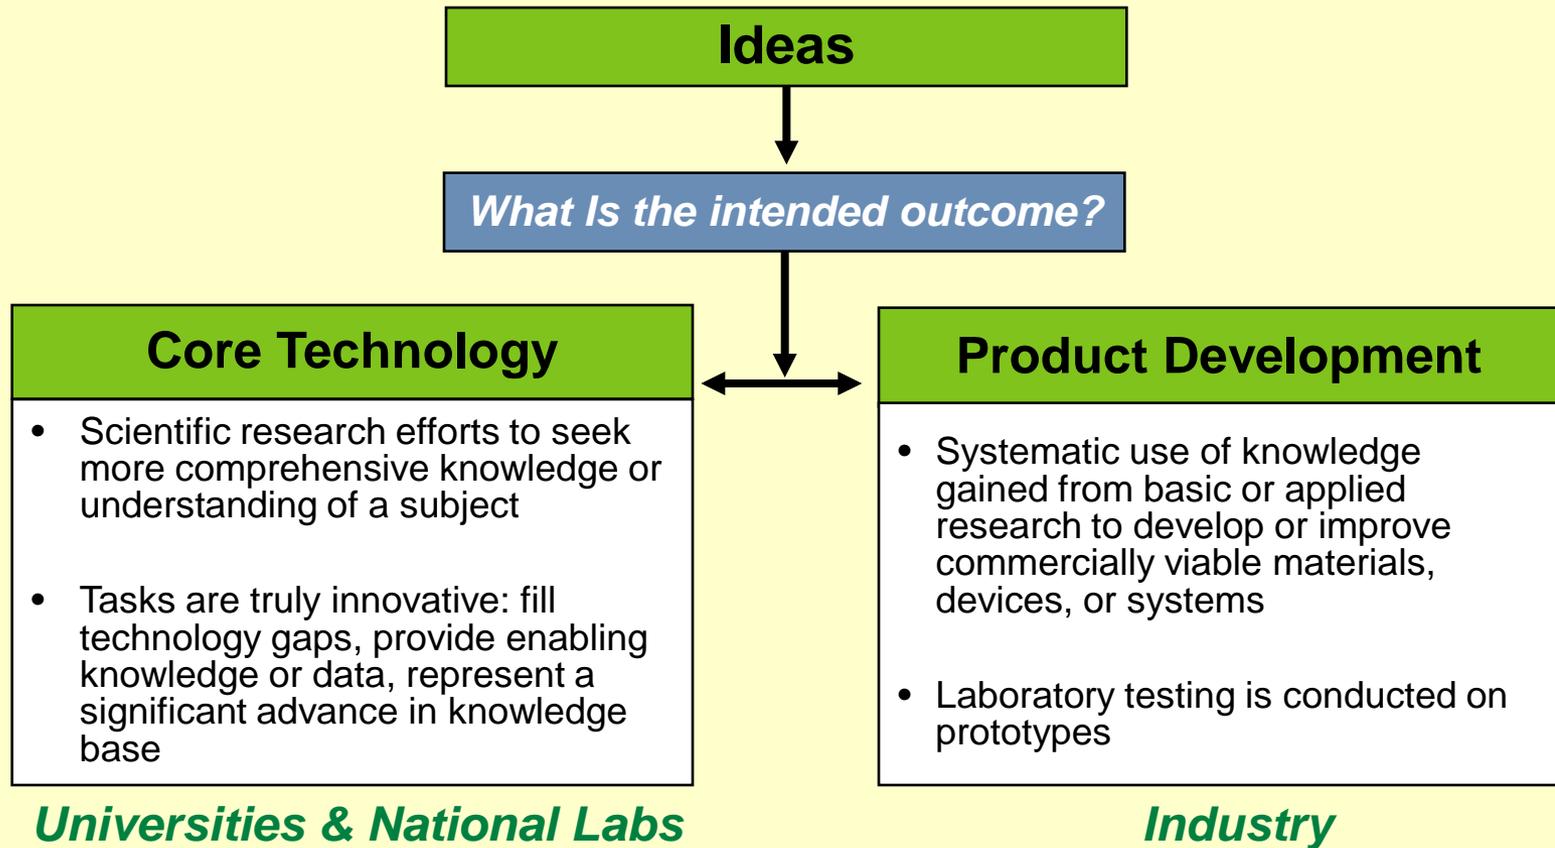

DOE/EERE Technology Roadmap goals

TECHNOLOGY	SSL-LED 2002	SSL-LED 2007	SSL-LED 2012	SSL-LED 2020	Incandescent	Fluorescent
Luminous Efficacy (lm/W)	25	75	150	200	16	85
Lifetime (hr)	20,000	>20,000	>100,000	>100,000	1,000	10,000
Flux (lm/lamp)	25	200	1,000	1,500	1,200	3,400
Input Power (W/lamp)	1	2.7	6.7	7.5	75	40
Lumens Cost (\$/klm)	200	20	<5	<2	0.4	1.5
Lamp Cost (\$/lamp)	5	<5	<5	<3	0.5	5
Color Rendering Index (CRI)	75	80	>80	>80	95	75

LED Technology Roadmap

**The SSL community
is just about on
target in 2006.**

DOE/EERE SSL Research Plan

The Energy Policy Act of 2005 is supportive of increased SSL R&D

Subtitle A - Energy Efficiency

SEC. 912. NEXT GENERATION LIGHTING INITIATIVE

“The Secretary shall carry out a Next Generation Lighting Initiative in accordance with this section to support research, development, demonstration, and commercial application activities related to advanced solid-state lighting technologies based on white light emitting diodes.”

Authorizes \$50M/year for 2006 through 2013 (8 years)

Subtitle F: Science

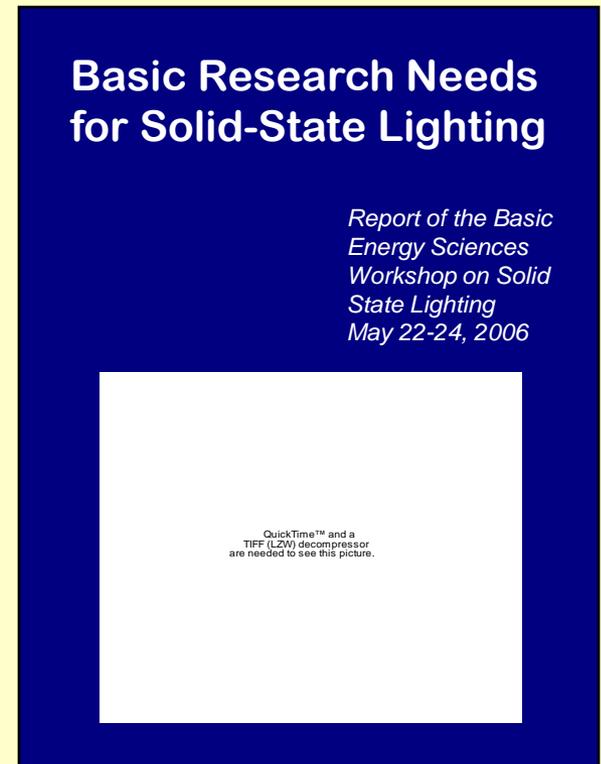

SEC. 966. SOLID STATE LIGHTING

“The Secretary shall conduct a program of fundamental research on advanced solid state lighting in support of the Next Generation Lighting Initiative carried out under section 912.”

DOE/Office of Science is interested in basic research relevant to SSL

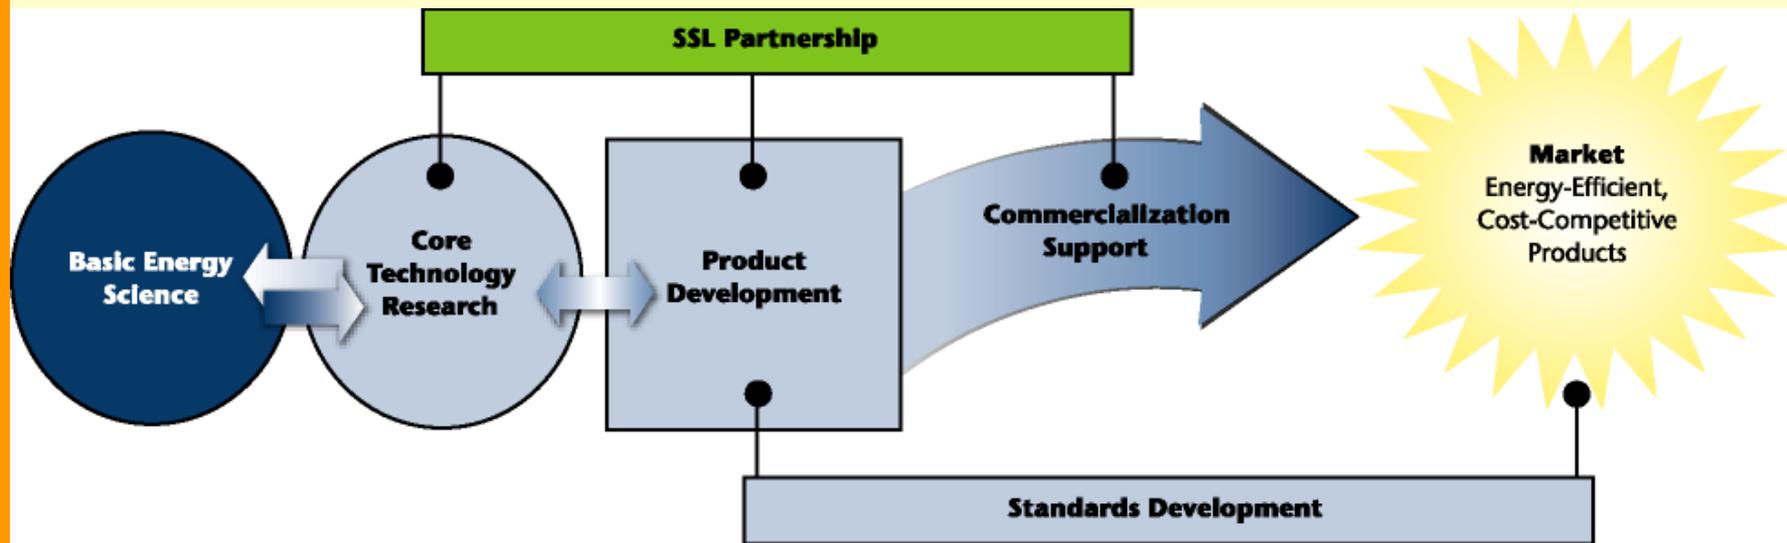

Basic Energy Sciences (BES) interest:

- 1) BES held a contractors meeting in Orlando Feb.1, in conjunction with the EERE/Building Technologies SSL Workshop
- 2) BES held a workshop on “Basic Research Needs for Solid State Lighting” in Bethesda May 22-24, 2006. A workshop report is expected in July.
- 3) A program would likely include basic research by the nation’s universities and government labs.

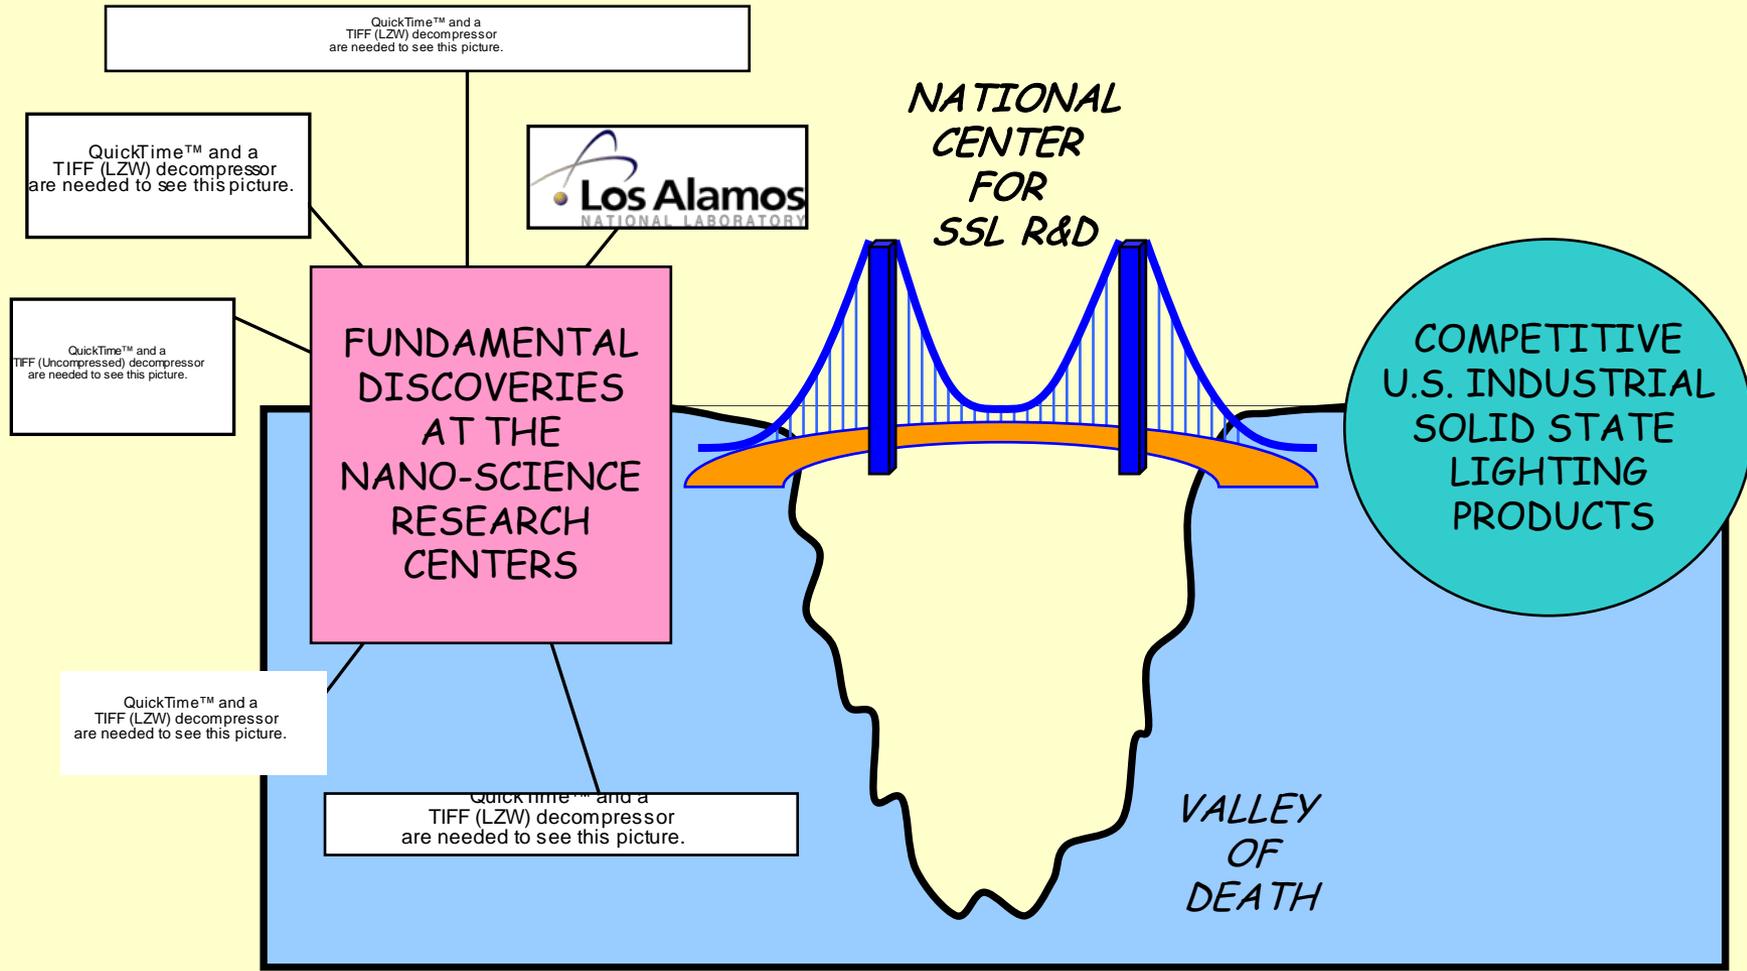

An unauthorized mock-up of the cover

A Five-Thrust Total SSL Program is Being Implemented by DOE

*Guiding technology advances from
laboratory to marketplace*

A National Center for SSL will be established to transition SSL nanoscience to industry

Summary

- 50% Energy Efficient Solid State Lighting will replace all conventional lighting in the next 25 years or so.
- Energy savings will be enormous: 10% reduction in total U.S. electricity use.
- Quality, agility, and “intelligence” of lighting will increase dramatically, enhancing our daily lives.
- Major R&D and Production taking place abroad.
- Government programs supporting Optics and Photonics will play a critical role in U.S. activities
