## Sierra/Aria Verification Manual – Version 5.26

Brian R. Carnes

Prepared by  
Sandia National Laboratories  
Albuquerque, New Mexico 87185  
Livermore, California 94550

Issued by Sandia National Laboratories, operated for the United States Department of Energy by National Technology & Engineering Solutions of Sandia, LLC.

**NOTICE:** This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States Government, nor any agency thereof, nor any of their employees, nor any of their contractors, subcontractors, or their employees, make any warranty, express or implied, or assume any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represent that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise, does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government, any agency thereof, or any of their contractors or subcontractors. The views and opinions expressed herein do not necessarily state or reflect those of the United States Government, any agency thereof, or any of their contractors.

Printed in the United States of America. This report has been reproduced directly from the best available copy.

Available to DOE and DOE contractors from

U.S. Department of Energy  
Office of Scientific and Technical Information  
P.O. Box 62  
Oak Ridge, TN 37831

# **ABSTRACT**

Presented in this document is a portion of the tests that exist in the Sierra Thermal/Fluids verification test suite. Each of these tests is run nightly with the Sierra/TF code suite and the results of the test checked under mesh refinement against the correct analytic result. For each of the tests presented in this document the test setup, derivation of the analytic solution, and comparison of the code results to the analytic solution is provided. This document can be used to confirm that a given code capability is verified or referenced as a compilation of example problems.

# ACKNOWLEDGMENTS

This document's authors acknowledge the help of the Sierra/TF team in creating and maintaining these verification tests.

# CONTENTS

|                                           |           |
|-------------------------------------------|-----------|
| <b>Contents</b>                           | <b>5</b>  |
| <b>List of Figures</b>                    | <b>19</b> |
| <b>List of Tables</b>                     | <b>21</b> |
| <b>1. Introduction</b>                    | <b>25</b> |
| <b>2. Basic Thermal Tests</b>             | <b>27</b> |
| 2.1. Steady Heat Conduction: Hex8 Meshes  | 27        |
| 2.1.1. Features Tested                    | 27        |
| 2.1.2. Boundary Conditions                | 27        |
| 2.1.3. Material Parameters                | 27        |
| 2.1.4. Verification of Solution           | 27        |
| 2.2. Steady Heat Conduction: Hex20 Meshes | 28        |
| 2.2.1. Features Tested                    | 29        |
| 2.2.2. Boundary Conditions                | 29        |
| 2.2.3. Material Parameters                | 29        |
| 2.2.4. Verification of Solution           | 29        |
| 2.3. Steady Heat Conduction: Hex27 Meshes | 30        |
| 2.3.1. Features Tested                    | 30        |
| 2.3.2. Boundary Conditions                | 30        |
| 2.3.3. Material Parameters                | 31        |
| 2.3.4. Verification of Solution           | 31        |
| 2.4. Steady Heat Conduction: Tet4 Meshes  | 32        |
| 2.4.1. Features Tested                    | 32        |

|         |                                                   |    |
|---------|---------------------------------------------------|----|
| 2.4.2.  | Boundary Conditions .....                         | 32 |
| 2.4.3.  | Material Parameters .....                         | 32 |
| 2.4.4.  | Verification of Solution .....                    | 32 |
| 2.5.    | Steady Heat Conduction: Tet4Tetro Meshes .....    | 33 |
| 2.5.1.  | Features Tested .....                             | 33 |
| 2.5.2.  | Boundary Conditions .....                         | 33 |
| 2.5.3.  | Material Parameters .....                         | 33 |
| 2.5.4.  | Verification of Solution .....                    | 34 |
| 2.6.    | Steady Heat Conduction: Tetro Meshes .....        | 34 |
| 2.6.1.  | Features Tested .....                             | 35 |
| 2.6.2.  | Boundary Conditions .....                         | 35 |
| 2.6.3.  | Material Parameters .....                         | 35 |
| 2.6.4.  | Verification of Solution .....                    | 35 |
| 2.7.    | Transient Heat Conduction: Hex8 Meshes .....      | 36 |
| 2.7.1.  | Features Tested .....                             | 36 |
| 2.7.2.  | Boundary Conditions .....                         | 36 |
| 2.7.3.  | Material Parameters .....                         | 36 |
| 2.7.4.  | Verification of Solution .....                    | 36 |
| 2.8.    | Transient Heat Conduction: Tet4 Meshes .....      | 37 |
| 2.8.1.  | Features Tested .....                             | 38 |
| 2.8.2.  | Boundary Conditions .....                         | 38 |
| 2.8.3.  | Material Parameters .....                         | 38 |
| 2.8.4.  | Verification of Solution .....                    | 38 |
| 2.9.    | Transient Heat Conduction: Tet4Tetro Meshes ..... | 39 |
| 2.9.1.  | Features Tested .....                             | 39 |
| 2.9.2.  | Boundary Conditions .....                         | 39 |
| 2.9.3.  | Material Parameters .....                         | 39 |
| 2.9.4.  | Verification of Solution .....                    | 39 |
| 2.10.   | Transient Heat Conduction: Tetro Meshes .....     | 40 |
| 2.10.1. | Features Tested .....                             | 40 |

|         |                          |    |
|---------|--------------------------|----|
| 2.10.2. | Boundary Conditions      | 40 |
| 2.10.3. | Material Parameters      | 41 |
| 2.10.4. | Verification of Solution | 41 |
| 2.11.   | PostProcess Min/Max      | 42 |
| 2.11.1. | Problem Description      | 42 |
| 2.11.2. | Features Tested          | 42 |
| 2.11.3. | Boundary Conditions      | 42 |
| 2.11.4. | Material Parameters      | 42 |
| 2.11.5. | Verification of Solution | 42 |
| 2.12.   | Adaptivity               | 43 |
| 2.12.1. | Features Tested          | 43 |
| 2.12.2. | Boundary Conditions      | 43 |
| 2.12.3. | Material Parameters      | 43 |
| 2.12.4. | Verification of Solution | 44 |

### **3. Thermal Boundary Conditions 47**

|        |                                                  |    |
|--------|--------------------------------------------------|----|
| 3.1.   | Radiative Heat Flux                              | 47 |
| 3.1.1. | Features Tested                                  | 47 |
| 3.1.2. | Boundary Conditions                              | 47 |
| 3.1.3. | Material Parameters                              | 47 |
| 3.1.4. | Verification of Solution                         | 47 |
| 3.2.   | Radiative Heat Flux From Fortran User Subroutine | 48 |
| 3.2.1. | Features Tested                                  | 48 |
| 3.2.2. | Boundary Conditions                              | 48 |
| 3.2.3. | Material Parameters                              | 49 |
| 3.2.4. | Verification of Solution                         | 49 |
| 3.3.   | Convective Heat Flux                             | 49 |
| 3.3.1. | Features Tested                                  | 49 |
| 3.3.2. | Boundary Conditions                              | 49 |
| 3.3.3. | Material Parameters                              | 49 |

|          |                                                                |    |

| 4.1-3. 1D Flat Contact: Tet4 Tied .....                                | 68  |
| 4.1-4. 1D Flat Contact: Tet4 Resistance .....                          | 69  |
| 4.1-5. 1D Flat Contact: Hex8-Tet4 Tied .....                           | 70  |
| 4.1-6. 1D Flat Contact: Hex8-Tet4 Resistance .....                     | 71  |
| 4.2-1. 3D Curved Contact: Hex8-Hex8 Case .....                         | 72  |
| 4.2-2. 3D Curved Contact: Tet4-Tet4 Case .....                         | 74  |
| 4.2-3. 3D Curved Contact: Hex8-Tet4 Case .....                         | 75  |
| 4.3-1. Steady Tied Contact: Hex8 Meshes .....                          | 77  |
| 4.4-1. Steady Heat Conduction: Hex20 Meshes .....                      | 78  |
| 4.5-1. Steady Heat Conduction: Hex27 Meshes .....                      | 80  |
| 4.6-1. Steady Tied Contact: Tet4 Meshes .....                          | 81  |
| 4.7-1. Steady Tied Contact: Tet4 Meshes .....                          | 82  |
| 4.8-1. Steady Tied Contact: Tet10 Meshes .....                         | 84  |
| 4.9-1. Steady Tied Dash Contact: Tet10 Meshes .....                    | 85  |
| 4.10-1. Transient Tied Contact: Tet10 Meshes .....                     | 86  |
| 4.11-1. Transient Tied Contact: Tet10 Meshes .....                     | 88  |
| 4.12-1. Tied Contact Transient Heat Conduction: Hex8 Meshes .....      | 89  |
| 4.13-1. Transient Heat Conduction with Tied Contact: Tet4 Meshes ..... | 91  |
| 5.1-1. CDFEM Element Death (Heat Flux): Tri3 .....                     | 94  |
| 5.1-2. CDFEM Element Death (Heat Flux): Tet4 .....                     | 95  |
| 5.2-1. Evolution of parameters $r_2$ and $C_o$ .....                   | 98  |
| 5.3-1. Element Death (Heat Flux): Hex8 .....                           | 100 |
| 5.3-2. Element Death (Heat Flux): Quad4 .....                          | 101 |
| 5.3-3. Element Death (Heat Flux): Tri3 .....                           | 102 |
| 5.3-4. Element Death (Heat Flux): Quad4 .....                          | 103 |
| 5.3-5. Element Death (Heat Flux): Hex8 .....                           | 104 |
| 6.1-1. Adaptive Time Integration: Errors for First Order Fixed .....   | 106 |

|                                                                          |     |
|--------------------------------------------------------------------------|-----|
| 6.1-2. Adaptive Time Integration: Errors for First Order Adaptive .....  | 107 |
| 6.1-3. Adaptive Time Integration: Errors for Second Order Fixed .....    | 108 |
| 6.1-4. Adaptive Time Integration: Errors for Second Order Adaptive ..... | 109 |
| 6.1-5. Adaptive Time Integration: Errors for BDF2 Fixed .....            | 110 |
| 6.1-6. Adaptive Time Integration: Errors for BDF2 Adaptive .....         | 111 |
| 7.1-1. Enclosure Radiation 2D .....                                      | 115 |
| 7.2-1. 2D Full Enclosure Radiation .....                                 | 117 |
| 7.3-1. Enclosure Radiation .....                                         | 121 |
| 7.4-1. Partial Enclosure Radiation .....                                 | 122 |
| 8.1-1. First Order Reaction (Spatially Varying Temperature) .....        | 124 |
| 8.2-1. First Order Reaction .....                                        | 126 |
| 9.1-1. Thermal Postprocess .....                                         | 130 |
| 9.2-1. Local Cartesian Coordinate System .....                           | 132 |
| 9.3-1. Local Cylindrical Coordinate System .....                         | 133 |

## LIST OF TABLES

# 1. INTRODUCTION

The Sierra/TF Verification Manual is divided into chapters based on related capabilities. Each section of a chapter represents a distinct verification test. Some problems that are not yet fully documented are listed at the end of each chapter.

All of these verification tests are run nightly by the development team to continually verify code accuracy under mesh refinement. The graphics and charts in this document are automatically generated by the nightly test runs.

The test files for these problems may be found in the Sierra regression test repository. Most are in the sub-directory called “verification.”

`aria_rtest/verification`

All tests are assigned the keyword “verification”. Those that appear in this document also have the keyword “self-documenting”.

For each test, the approximate finite element solution  $T_h$  is compared to the exact solution  $T$  using several global norms, and in some cases using response quantities of interest. This is repeated over a series of uniformly refined meshes (not necessarily nested) with mesh sizes  $\{h_i\}$ , giving a sequence of errors  $\{E_i\}$ . For each pair of meshes, a convergence rate is estimated using the formula

$$r_i \equiv \log(E_i/E_{i-1})/\log(h_i/h_{i-1}). \quad (1.1)$$

The convergence of  $r_i$  to the expected rate is monitored as the mesh is refined. A test passes if all of the estimated convergence rates on the finest pair of meshes are within a given tolerance of the expected rates.

This page intentionally left blank.

## 2. BASIC THERMAL TESTS

### 2.1. STEADY HEAT CONDUCTION: HEX8 MESHES

This problem tests basic steady state heat conduction in a 3D domain. The geometry consists of a unit cube. A variety of different source terms and boundary conditions are simultaneously applied. The exact solution is a manufactured solution.

#### 2.1.1. Features Tested

Basic heat conduction on Hex8 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

#### 2.1.2. Boundary Conditions

At surfaces 4 and 6, the temperature is prescribed as a constant value. On surfaces 3 and 5, a heat flux condition is prescribed using a sum of a constant heat flux and a heat flux from an Encore function (user subroutine). On surfaces 1 and 2, heat flux condition is prescribed using a sum of a convective flux boundary condition (with constant flux and convective coefficient) and a heat flux from an Encore function (user subroutine). Within the domain a source term is prescribed using a sum of a constant source and an Encore function (user subroutine).

#### 2.1.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

#### 2.1.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, z) = 1 + (x - x^2)^2(y - y^2)^2(z - z^2)^2.$$

The source and heat flux user subroutines are chosen so that the solution satisfies the heat equation with the correct boundary conditions.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

## 2.2. STEADY HEAT CONDUCTION: HEX20 MESHES

This problem tests basic steady state heat conduction in a 3D domain. The geometry consists of a unit cube. A variety of different source terms and boundary conditions are simultaneously applied. The exact solution is a manufactured solution.

### 2.2.1. Features Tested

Basic heat conduction on Hex20 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 2.2.2. Boundary Conditions

At surfaces 4 and 6, the temperature is prescribed as a constant value. On surfaces 3 and 5, a heat flux condition is prescribed using a sum of a constant heat flux and a heat flux from an Encore function (user subroutine). On surfaces 1 and 2, heat flux condition is prescribed using a sum of a convective flux boundary condition (with constant flux and convective coefficient) and a heat flux from an Encore function (user subroutine). Within the domain a source term is prescribed using a sum of a constant source and an Encore function (user subroutine).

### 2.2.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 2.2.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, z) = 1 + (x - x^2)^2(y - y^2)^2(z - z^2)^2.$$

The source and heat flux user subroutines are chosen so that the solution satisfies the heat equation with the correct boundary conditions.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

For input decks see Appendix [12.1.2](#).

**Figure 2.2-1.. Steady Heat Conduction: Hex20 Meshes**

## 2.3. STEADY HEAT CONDUCTION: HEX27 MESHES

This problem tests basic steady state heat conduction in a 3D domain. The geometry consists of a unit cube. A variety of different source terms and boundary conditions are simultaneously applied. The exact solution is a manufactured solution.

### 2.3.1. Features Tested

Basic heat conduction on Hex27 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 2.3.2. Boundary Conditions

At surfaces 4 and 6, the temperature is prescribed as a constant value. On surfaces 3 and 5, a heat flux condition is prescribed using a sum of a constant heat flux and a heat flux from an Encore function (user subroutine). On surfaces 1 and 2, heat flux condition is prescribed using a sum of a convective flux boundary condition (with constant flux and convective coefficient) and a heat flux from an Encore function (user subroutine). Within the domain a source term is prescribed using a sum of a constant source and an Encore function (user subroutine).

2.3.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

2.3.4. Verification of Solution

A manufactured solution is chosen as

$$T(x,y,z) = 1 + (x - x^2)^2(y - y^2)^2(z - z^2)^2.$$

The source and heat flux user subroutines are chosen so that the solution satisfies the heat equation with the correct boundary conditions.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

Figure 2.3-1.. Steady Heat Conduction: Hex27 Meshes

| 117649   | 3.06  | 2.05  | 4.08       |

For input decks see Appendix [12.1.3](#).

## 2.4. STEADY HEAT CONDUCTION: TET4 MESHES

This problem is identical to the one in Section [2.1](#) except that unstructured Tet4 meshes are used instead. The meshes are obtained from Cubit.

### 2.4.1. Features Tested

Basic heat conduction on Tet4 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 2.4.2. Boundary Conditions

Same as in Section [2.1](#).

### 2.4.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 2.4.4. Verification of Solution

Same as in Section [2.1](#).

Unlike the Hex8 case, we have observed in many cases, and in this test, that the convergence rate for the temperature in the  $L^\infty$  norm is somewhat less than 2, in this case about 1.9. The exact reason for this behavior is unclear.

**Table 2.4-1.. Steady Heat Conduction: Convergence Rates for Tet4 Meshes**

| Num Dofs | $L^2$ | $H^1$ | $L^\infty$ |
|----------|-------|-------|------------|
| 145      | 1.27  | 0.57  | 0.24       |
| 1104     | 2.37  | 1.22  | 2.95       |
| 7725     | 2.06  | 1.03  | 1.65       |
| 59636    | 2.00  | 0.99  | 1.77       |
| 469317   | 1.98  | 0.99  | 1.65       |

For input decks see Appendix [12.1.4](#).

Coarse Mesh

Error Norms

**Figure 2.4-1.. Steady Heat Conduction: Tet4 Meshes**

## 2.5. STEADY HEAT CONDUCTION: TET4TET10 MESHES

This problem is identical to the one in Section 2.1 with the exception of constant thermal conductivity and use of unstructured Tet10 meshes. The meshes are obtained from Cubit.

### 2.5.1. Features Tested

Basic heat conduction with Tet4 solution on Tet10 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 2.5.2. Boundary Conditions

Same as in Section 2.1.

### 2.5.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

## 2.5.4. Verification of Solution

Same as in Section 2.1.

Unlike the Hex8 case, we have observed in many cases, and in this test, that the convergence rate for the temperature in the  $L^\infty$  norm is somewhat less than 2, in this case about 1.9. The exact reason for this behavior is unclear.

Coarse Mesh

Error Norms

**Figure 2.5-1.. Steady Heat Conduction: Tet4 Solutions on Tet10 Meshes**

| 464414   | 1.96  | 0.98  | 1.81       |

For input decks see Appendix 12.1.5.

## 2.6. STEADY HEAT CONDUCTION: TET10 MESHES

This problem is identical to the one in Section 2.1 except that unstructured Tet10 meshes are used instead. The meshes are obtained from Cubit.

### 2.6.1. Features Tested

Basic heat conduction on Tet10 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 2.6.2. Boundary Conditions

Same as in Section 2.1.

### 2.6.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 2.6.4. Verification of Solution

Same as in Section 2.1.

Unlike the Hex8 case, we have observed in many cases, and in this test, that the convergence rate for the temperature in the  $L^\infty$  norm is somewhat less than 3, in this case about 2.7. The exact reason for this behavior is unclear.

Coarse Mesh

Error Norms

**Figure 2.6-1.. Steady Heat Conduction: Tet10 Meshes**

For input decks see Appendix 12.1.6.

**Table 2.6-1.. Steady Heat Conduction: Convergence Rates for Tet10 Meshes**

| Num Dofs | $L^2$ | $H^1$ | $L^\infty$ |

| 464414   | 2.75  | 1.84  | 2.84       |

## 2.7. TRANSIENT HEAT CONDUCTION: HEX8 MESHES

This problem tests basic transient heat conduction in a 3D domain. The geometry consists of a unit cube.

### 2.7.1. Features Tested

Basic transient heat conduction on Hex8 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 2.7.2. Boundary Conditions

At surfaces 4 and 6, the temperature is prescribed as a constant value. On surfaces 3 and 5, a heat flux condition is prescribed using a sum of a constant heat flux and a heat flux from an Encore function (user subroutine). On surfaces 1 and 2, heat flux condition is prescribed using a sum of a convective flux boundary condition (with constant flux and convective coefficient) and a heat flux from an Encore function (user subroutine). Within the domain a source term is prescribed using a sum of a constant source and an Encore function (user subroutine).

### 2.7.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 2.7.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, z, t) = (x - x^2)^2 (y - y^2)^2 (z - z^2)^2 m(t) + 1,$$

$$m(t) = 10^4 (1 - \exp(-t) + t \exp(-(t - 1)^2))$$

The source and heat flux user subroutines are chosen so that the solution satisfies the heat equation with the correct boundary conditions.

For each mesh, the errors in the temperature solution at final time are computed in the  $L^2$  norm of  $T$  and  $\dot{T}$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, 2 and 1, respectively (within a tolerance).

Coarse Mesh

Error Norms

For input decks see Appendix [12.1.7](#).

## 2.8. TRANSIENT HEAT CONDUCTION: TET4 MESHES

This problem tests basic transient heat conduction in a 3D domain as in Section [2.7](#). The geometry consists of a unit cube and a single bulk fluid element.

## 2.8.1. Features Tested

Basic transient heat conduction on Tet4 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; bulk fluid element; heat flux and source term from Encore user subroutines.

## 2.8.2. Boundary Conditions

Identical to Section 2.7 except one convective flux boundary condition is now connected to a bulk fluid element.

## 2.8.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

## 2.8.4. Verification of Solution

A manufactured solution is chosen as in Section 2.7.

For each mesh, the errors in the temperature solution at final time are computed in the  $L^2$  norm of  $T$  and  $\dot{T}$ ,  $L^\infty$  and  $H^1$  norms. As in Section 2.4, we see convergence rates for  $L^\infty$  that are slightly less than 2.

| 7726     | 2.07     | 2.16           | 1.03  | 1.64       | 2.26                 |

## 2.9. TRANSIENT HEAT CONDUCTION: TET4TET10 MESHES

This problem tests basic transient heat conduction in a 3D domain as in Section 2.8. The geometry consists of a unit cube.

### 2.9.1. Features Tested

Basic transient heat conduction Tet4 analysis on Tet10 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 2.9.2. Boundary Conditions

Identical to Section 2.8

### 2.9.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 2.9.4. Verification of Solution

A manufactured solution is chosen as in Section 2.8.

For each mesh, the errors in the temperature solution at final time are computed in the  $L^2$  norm of  $T$  and  $\dot{T}$ ,  $L^\infty$  and  $H^1$  norms. As in Section 2.8, we see convergence rates for  $L^\infty$  that are slightly less than 2.

For input decks see Appendix 12.1.9.

## 2.10. TRANSIENT HEAT CONDUCTION: TET10 MESHES

This problem tests basic transient heat conduction in a 3D domain as in Section 2.7. The geometry consists of a unit cube.

### 2.10.1. Features Tested

Basic transient heat conduction on Tet10 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 2.10.2. Boundary Conditions

Identical to Section 2.7

### 2.10.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 2.10.4. Verification of Solution

A manufactured solution is chosen as in Section 2.7.

For each mesh, the errors in the temperature solution at final time are computed in the  $L^2$  norm of  $T$  and  $\dot{T}$ ,  $L^\infty$  and  $H^1$  norms. As in Section 2.6, we see convergence rates for  $L^\infty$  that are slightly less than 2.

Coarse Mesh

Error Norms

For input decks see Appendix 12.1.10.

## 2.11. POSTPROCESS MIN/MAX

### 2.11.1. Problem Description

This problem tests the min/max postprocessors in Aria.

### 2.11.2. Features Tested

min max postprocessors

### 2.11.3. Boundary Conditions

Dirichlet BCs are specified using the exact solution on surfaces 1-4.

A source term is applied within all blocks based on substituting the exact solution into the heat conduction operator.

### 2.11.4. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant.

### 2.11.5. Verification of Solution

The manufactured solution is

$$\sin(7x) \sin(8y).$$

For each uniformly refined mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $H^1$ , and  $L^\infty$  norms and for various postprocessors. Additionally, the nodal maximum and minimum values on both block 1 and surface 2 are computed using Encore postprocessors and the convergence of these values is compared as well. Since the maximum and minimums are nodal, the location of the nodes will reflect the max/min values produced for a given mesh. Provided that the mesh is uniformly refined (without smoothing that may shift the nodal locations), every mesh refinement will produce a better result, dependent on how much closer to the maximum/minimum true solution the new nodes are.

**Table 2.11-1.. Min Max Postprocess: Convergence Rates**

| Num Dofs | $L^2$ | $H^1$ | $L^\infty$ | $error\_b1\_max$ | $error\_b1\_min$ | $error\_s2\_max$ | $error\_s2\_min$ |
|----------|-------|-------|------------|------------------|------------------|------------------|------------------|
| 625      | 2.00  | 1.00  | 1.55       | 1.92             | 0.40             | 0.46             | 2.83             |
| 37249    | 2.03  | 1.02  | 1.81       | 1.88             | 2.37             | 1.99             | 2.37             |

Error Norms

**Figure 2.11-1.. Min Max Postprocess**

## 2.12. ADAPTIVITY

This problem is identical to the one in Section 2.4 except that we use adaptive mesh refinement to refine from a coarse base mesh obtained from Cubit.

### 2.12.1. Features Tested

Basic heat conduction on Tet4 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines; adaptive mesh refinement; local error indicators based on jump in heat flux.

### 2.12.2. Boundary Conditions

Same as in Section 2.1.

### 2.12.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

## 2.12.4. Verification of Solution

The mesh is adapted using code from Sierra/Percept that refines tetrahedral meshes without any hanging nodes (conformal meshes only). The element error indicator is computed using a residual-based error indicator in Encore, that computes the integrated jump in the normal heat flux across inter-element faces. The input file is configured to refine elements so that the sum of the error in the refined elements is approximately 75% of the total error in all elements.

Because of variability in the meshes, we expect the error reduction to be noisy. In this case, we use linear least squares to estimate the slope of the error on a log-log plot against mesh size. Since the solution is smooth we also expect the meshes to eventually refine everywhere. We estimate convergence in the usual error norms and observe rates close to the theoretical ones (second order convergence for the  $L^2$  and  $L^\infty$  norms and first order convergence for the  $H^1$  norm). Mesh size is estimated using the formula  $h \approx N^{-1/3}$ , where  $N$  is the number of nodes in the mesh.

## 3. THERMAL BOUNDARY CONDITIONS

### 3.1. RADIATIVE HEAT FLUX

This problem tests the radiative flux boundary condition under steady state heat conduction in a 2D domain. The geometry consists of a unit square.

#### 3.1.1. Features Tested

Basic heat conduction on Quad4 meshes; radiative flux boundary conditions with constant emissivity and reference temperature; radiation form factor from C-style user subroutine; temperature boundary conditions from C-style user subroutine and constant values.

#### 3.1.2. Boundary Conditions

At surface 3, the temperature is prescribed from a C-style user subroutine. On surfaces 2 and 4, a constant temperature boundary condition is used. On surface 1, a radiative heat flux condition is prescribed. No source term is needed.

#### 3.1.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant.

#### 3.1.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y) = 200 \exp(-\pi y) \sin(\pi x) + 600$$

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $H^1$  and  $L^\infty$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 1, and 2, respectively (within a tolerance).

For input decks see Appendix [12.2.1](#).

Coarse Mesh

Error Norms

| Num Dofs | $L^2$ | $H^1$ | $L^\infty$ |
|----------|-------|-------|------------|
| 121      | 2.27  | 1.13  | 2.21       |
| 441      | 2.14  | 1.07  | 2.15       |
| 1681     | 2.07  | 1.04  | 2.07       |

## 3.2. RADIATIVE HEAT FLUX FROM FORTRAN USER SUBROUTINE

This test verifies that a user-supplied subroutine for convective coefficient and reference temperature (restricted to a surface patch) produces the same results as the equivalent input syntax with constant values. The user subroutine is applied to the entire exterior surface, while the case using constant values must be applied only to specific sidesets that span a portion of the exterior surface.

### 3.2.1. Features Tested

Basic heat conduction on a Hex8 mesh; convective and radiative flux BCs, Fortran user subroutines.

### 3.2.2. Boundary Conditions

Convective and radiative flux BCs are applied to the exterior boundary.

### **3.2.3. Material Parameters**

The values of density, thermal conductivity, emissivity and specific heat are all constant.

### **3.2.4. Verification of Solution**

The test compares Exodus output between two input files. The first does not use any user subroutines and instead relies on sidesets to apply the correct convective and radiative boundary conditions with constant coefficients. The second uses a single convective boundary condition with user subroutines for both the convective coefficient and reference temperature. The two input files produce results that agree to the default tolerances in the exodiff script.

For input decks see Appendix [12.2.2.](#)

## **3.3. CONVECTIVE HEAT FLUX**

This problem tests the convective flux boundary condition under transient heat conduction in a 2D domain. The geometry consists of a unit square.

### **3.3.1. Features Tested**

Transient heat conduction on Quad4 meshes; convective flux boundary conditions with user subroutines for convective coefficient and reference temperature; temperature boundary conditions from C-style user subroutine and constant values.

### **3.3.2. Boundary Conditions**

At surface 3, the temperature is prescribed from a C-style user subroutine. On surfaces 2 and 4, a constant temperature boundary condition is used. On surface 1, a convective heat flux condition is prescribed. No source term is needed. The initial condition is provided by a C-style user subroutine

### **3.3.3. Material Parameters**

The values of density, thermal conductivity, and specific heat are all constant.

### 3.3.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, t) = 100 \exp(-2\pi^2 t) \sin(\pi x) (\cos(\pi y) + \sin(\pi y))$$

Because the solution is based on eigenfunctions, it satisfies the heat equation with no source term.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

For input decks see Appendix [12.2.3](#).

## 3.4. THERMAL CONVECTIVE FLUX (FORTRAN SUB-ROUTINE)

### 3.4.1. Problem Description

This problem tests the convective flux boundary condition with a convective coefficient Fortran subroutine for a steady thermal problem in a 3D domain whose geometry consists of a unit-sized cube.

### 3.4.2. Features Tested

Convective Flux BC, Convective Coefficient Fortran Subroutine, user subroutine, integrated flux, integrated power

### 3.4.3. Boundary Conditions

Convective flux boundary conditions are imposed on surfaces 1 and 2. Dirichlet BCs are specified using the exact solution on surfaces 3-6. A source term is applied within all blocks based on substituting the exact solution into the heat conduction operator.

### 3.4.4. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant.

### 3.4.5. Verification of Solution

The manufactured solution is

$$T(x, y, z) = (x - x^2)^2(y - y^2)^2(z - z^2)^2 + (z + z^2).$$

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $H^1$ , and  $L^\infty$  norms.

**Table 3.4-1.. Thermal Convective BC: Convergence Rates**

| Num Dofs | $L^2$ | $H^1$ | $L^\infty$ |

## 3.5. THERMAL CONVECTIVE FLUX (USER FIELD FROM EXODUS READ-IN)

### 3.5.1. Problem Description

This problem evaluates a convective flux boundary condition with a convective coefficient and a reference temperature from an exodus file for a steady thermal problem in a 3D domain whose geometry consists of a unit-sized cube.

### 3.5.2. Features Tested

Convective Flux BC, Convective Coefficient, transfers, user subroutine, integrated flux, integrated power

### 3.5.3. Boundary Conditions

Convective flux boundary conditions are imposed on surfaces 1 and 2. Dirichlet BCs are specified using the exact solution on surfaces 3-6. A source term is applied within all blocks based on substituting the exact solution into the heat conduction operator.

### 3.5.4. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant.

### 3.5.5. Verification of Solution

The manufactured solution is

$$T(x, y, z) = (x - x^2)^2(y - y^2)^2(z - z^2)^2 + (z^2 + z).$$

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $H^1$ , and  $L^\infty$  norms.

## 3.6. THERMAL RADIATIVE HEAT FLUX

### 3.6.1. Basic Calore-Style BC

#### 3.6.1.1. Problem Description

This problem evaluates a steady thermal solution with radiative heat flux boundary conditions on a 3D unit cube domain.

#### 3.6.1.2. Features Tested

Basic heat conduction, Calore style radiative heat flux BCs, Integrated Flux Output, Integrated Power Output, Hex8 meshes.

#### 3.6.1.3. Boundary Conditions

Dirichlet BCs are specified using the exact solution on surfaces 2-6. On surface 1, a radiative heat flux BC is specified with constant emissivity and a radiation form factor of 0.2. A source term is applied within all blocks based on substituting the exact solution into the heat conduction operator.

#### 3.6.1.4. Material Parameters

The values of density, thermal conductivity, specific heat, and emissivity are all constant values.

#### 3.6.1.5. Verification of Solution

The manufactured solution is

$$T(x, y, z) = (x - x^2)^2(y - y^2)^2(z - z^2)^2 + T - \frac{\partial T}{\partial n}(z^2 - z).$$

For each discretization, the errors in the temperature solution are computed in the  $L^2$ ,  $H^1$ , and  $L^\infty$  norms. The observed rates of convergence are 2 (except for the  $L^\infty$  norm, with convergence order 1).

**Table 3.6-1.. Thermal Radiative Flux BC: Convergence Rates**

| Num Dofs | $L^2$ | $L^\infty$ | $H^1$ |
|----------|-------|------------|-------|

## 3.6.2. With Fortran Subroutines

### 3.6.2.1. Problem Description

This problem evaluates a steady thermal solution with radiative heat flux boundary conditions using Fortran subroutines on a 3D unit cube domain.

### 3.6.2.2. Features Tested

Basic heat conduction, Calore style radiative heat flux BCs, Integrated Flux Output, Integrated Power Output, Hex8 meshes, Fortran subroutines.

### 3.6.2.3. Boundary Conditions

Dirichlet BCs are specified using the exact solution on surfaces 2-6. On surface 1, a radiative heat flux BC is specified with emissivity, reference temperature, and radiation form factor of provided by Fortran subroutines. A source term is applied within all blocks based on substituting the exact solution into the heat conduction operator.

### 3.6.2.4. Material Parameters

The values of density, thermal conductivity, specific heat, and emissivity are all constant values.

### 3.6.2.5. Verification of Solution

The manufactured solution is

$$T(x, y, z) = (x - x^2)^2(y - y^2)^2(z - z^2)^2 + T - \frac{\partial T}{\partial n}(z^2 - z).$$

For each discretization, the errors in the temperature solution are computed in the  $L^2$ ,  $H^1$ , and  $L^\infty$  norms. The observed rates of convergence are 2 (except for the  $L^\infty$  norm, with convergence order 1).

### 3.6.3. With User Subroutines

#### 3.6.3.1. Problem Description

This problem evaluates a steady thermal solution with radiative heat flux boundary conditions with user subroutines on a 3D unit cube domain.

### 3.6.3.2. *Features Tested*

Basic heat conduction, Calore style radiative heat flux BCs, Integrated Flux Output, Integrated Power Output, Hex8 meshes, user subroutines.

### 3.6.3.3. *Boundary Conditions*

Dirichlet BCs are specified using the exact solution on surfaces 2-6. On surface 1, a radiative heat flux BC is specified with emissivity, reference temperature and radiation form factor provided by user subroutines. A source term is applied within all blocks based on substituting the exact solution into the heat conduction operator.

### 3.6.3.4. *Material Parameters*

The values of density, thermal conductivity, specific heat, and emissivity are all constant values.

### 3.6.3.5. *Verification of Solution*

The manufactured solution is

$$T(x, y, z) = (x - x^2)^2(y - y^2)^2(z - z^2)^2 + T - \frac{\partial T}{\partial n}(z^2 - z).$$

For each discretization, the errors in the temperature solution are computed in the  $L^2$ ,  $H^1$ , and  $L^\infty$  norms. The observed rates of convergence are 2 (except for the  $L^\infty$  norm, with convergence order 1).

| 35937    | 2.09  | 1.05       | 2.10  |

## 3.7. **ADVECTIVE BAR**

Advective bar model verification tests.

### 3.7.1. **Steady Advection-Diffusion**

The three dimensional Bar2 meshes of one element block are generated in Cubit.

Coarse Mesh

Error Norms

**Figure 3.6-3.. Thermal Radiative Flux**

### 3.7.2. Features Tested

Steady heat conduction on 3D Bar2 meshes, Dirichlet boundary conditions, constant source term, advection and SUPG stabilization.

### 3.7.3. Boundary Conditions

$$T(0) = T(1) = 0$$

### 3.7.4. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in the block.

### 3.7.5. Verification of Solution

Solution verification is carried out by computing the error in the numerical solution based upon comparison with the analytic solution.

$$T(x) = \frac{1}{\rho CV} \left[ x - \frac{1 - \exp(x\gamma)}{1 - \exp(\gamma)} \right]$$

where  $\gamma = \rho CV/k$  where  $\rho$  is the density,  $C$  is specific heat,  $k$  is the thermal conductivity and  $V$  is the advection velocity. In this test, we find that the convergence rate for the temperature in the  $L^\infty$  and  $L^2$  norms are 2.

**Figure 3.7-1.. Steady Advection Conduction: 3D Bar2 Meshes**

**Table 3.7-1.. Steady Advection Conduction: Convergence Rates for 3D Bar2 Meshes**

| Num Dofs | $L^2$ | $L^\infty$ |

### 3.7.6. Transient Advection-Diffusion

The three dimensional Bar2 meshes of one element block are generated in Cubit.

### 3.7.7. Features Tested

Transient heat conduction on 3D Bar2 meshes, Dirichlet boundary conditions and Encore function source term.

### 3.7.8. Boundary Conditions

Dirichlet boundary conditions on the bar ends based upon the manufactured solution  $T(x)$

$$T(0) = T(1) = T_i$$

### 3.7.9. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in the bar block.

### 3.7.10. Verification of Solution

Solution verification is carried out by computing the error in the numerical solution based upon comparison with the analytic solution.

$$T(x) = T_i + Atx(x - 1) \exp(-Bt) \exp(-Bx)$$

In this test, we find that the convergence rate for the temperature in the  $L^\infty$  and  $L^2$  norms are 2.

**Figure 3.7-2.. Transient Heat Conduction: 3D Bar2 Meshes**

### 3.7.11. Transient Advection-Diffusion in 2D

The two dimensional Bar2 meshes of one element block are generated in Cubit.

**Table 3.7-2.. Transient Heat Conduction: Convergence Rates for 3D Bar2 Meshes**

**Figure 3.7-3.. Transient Heat Conduction: Bar2 Meshes**

## 3.8. SOLUTION VERIFICATION

This test is for a Mock AFF (including a metal case, foam, mock components, and temperature-dependent properties) that uses extrapolation to determine an approximation to the exact solution as a function of the results from three levels of meshes.

### 3.8.1. Features Tested

Extrapolation, Radiative flux boundary condition

### 3.8.2. Material Parameters

Constant density, emissivity. Temperature dependent user functions for specific heat and thermal conductivity.

### 3.8.3. Verification of Solution

Quantities of interest are the maximum, minimum, and average temperatures on both blocks and points. There is no manufactured solution in this case, instead an extrapolated solution is calculated and used to measure convergence and approximate the absolute error for a given mesh resolution.

Documentation for the following tests is in progress:

```
nic_material_decomposition/organic_material_decomposition.test|np4
```

**Figure 3.8-1.. Mock AFF Solution Verification**

**Figure 3.8-2.. The convergence rates can vary over time and between QOIs**

## 4. THERMAL CONTACT

### 4.1. 1D FLAT CONTACT

This problem tests thermal contact along a flat surface using 3D domains. The geometry consists of two thick blocks, which are in contact along a common flat surface. The mesh nodes on either side of the contact surface are not aligned in general.

In this problem we observe sub-optimal convergence rates in the  $L^\infty$  norm when using Tet elements. This is a known issue with unknown cause.

The contact search tolerances are fixed for all meshes, with a zero tangential and normal tolerances.

#### 4.1.1. Features Tested

Basic heat conduction, tied and resistance thermal contact between non-matching meshes (Hex-Hex, Tet-Tet, Hex-Tet).

#### 4.1.2. Boundary Conditions

The interface between the two blocks is a thermal contact boundary condition. Both tied contact and resistance contact (with finite contact resistance) are tested. The left and right boundary conditions are prescribed using constant values. The remaining boundary conditions are adiabatic. A constant source term is applied in each block (with different signs).

#### 4.1.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

#### 4.1.4. Verification of Solution

A manufactured solution is chosen based on the contact interface at  $x = 0$ :

$$T(x, y, z) = \begin{cases} \frac{1}{2}(1+x)(\gamma+x), & x < 0, \\ 1 + \frac{1}{2}(1-x)(-\gamma+x), & x > 0 \end{cases}$$

where  $\gamma = (2 - R)/(2 + R)$  is a constant depending on the thermal contact resistance  $R$ . Here  $R$  is the inverse of the contact conductance that is provided as a code input. In the case of tied contact,  $R = 0$  and therefore  $\gamma = 1$ . We note that when  $R > 0$ , this exact solution exhibits a jump in temperature across the contact interface.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

These rates are observed for the Hex-Hex case; however, both of the cases involving Tet meshes exhibit a reduced order of convergence in the  $L^\infty$  norms (convergence rate about 1.7).

For input decks see Appendix [12.3.1](#).

### 4.2. 3D CURVED CONTACT

This problem tests thermal contact along a curved surface in 3D. The geometry consists of two thick spherical shells, which are in contact along a shared surface. The mesh nodes on either side of the contact surface are not aligned in general.

In this problem we observe sub-optimal convergence rates in the  $L^\infty$  norm when using tet elements. This is a known issue with unknown cause.

The contact search tolerances are fixed for all meshes, with a zero tangential tolerance and a normal tolerance large enough to insure a proper contact search on the coarsest mesh.

Coarse Mesh

| 462762   | 2.01  | 1.57       | 1.02  |

### 4.2.1. Features Tested

Basic heat conduction, tied thermal contact between non-matching meshes (hex-hex, tet-tet, hex-tet).

### 4.2.2. Boundary Conditions

The interface between the two blocks is a tied thermal contact boundary condition. The outer and inner boundary conditions are prescribed at the nodes using the analytic solution.

### 4.2.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

#### 4.2.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, z) = -3x^2z - 3y^2z + 2z^3$$

This solution is harmonic, implying that no source term is needed for the steady state heat equation with constant conductivity.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

These rates are observed for the hex-hex case; however, both of the cases involving tet meshes exhibit a reduced order of convergence in the  $L^\infty$  norms (convergence rate about 1.7).

For input decks see Appendix 12.3.2.

## 4.3. STEADY HEX8 CONTACT

This problem tests basic steady state heat conduction in a 3D domain. The geometry consists of a unit cube.

### 4.3.1. Features Tested

Basic heat conduction on Hex8 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 4.3.2. Boundary Conditions

At surfaces 4 and 6, the temperature is prescribed as a constant value. On surfaces 3 and 5, a heat flux condition is prescribed using a sum of a constant heat flux and a heat flux from an Encore function (user subroutine). On surfaces 1 and 2, heat flux condition is prescribed using a sum of a convective flux boundary condition (with constant flux and convective coefficient) and a heat flux from an Encore function (user subroutine). Within the domain a source term is prescribed using a sum of a constant source and an Encore function (user subroutine).

### 4.3.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 4.3.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, z) = 1 + (x - x^2)^2(y - y^2)^2(z - z^2)^2.$$

The source and heat flux user subroutines are chosen so that the solution satisfies the heat equation with the correct boundary conditions.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

**Table 4.3-1.. Steady Tied Contact: Convergence Rates for Hex8 Meshes**

| Num Dofs | $L^2$ | $H^1$ | $L^\infty$ |
|----------|-------|-------|------------|
| 192      | 0.86  | -0.44 | 1.76       |

## 4.4. STEADY HEX20 CONTACT

This problem tests basic steady state heat conduction in a 3D domain. The geometry consists of a unit cube. A variety of different source terms and boundary conditions are simultaneously applied. The exact solution is a manufactured solution.

### 4.4.1. Features Tested

Basic heat conduction on Hex20 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 4.4.2. Boundary Conditions

At surfaces 4 and 6, the temperature is prescribed as a constant value. On surfaces 3 and 5, a heat flux condition is prescribed using a sum of a constant heat flux and a heat flux from an Encore function (user subroutine). On surfaces 1 and 2, heat flux condition is prescribed using a sum of a convective flux boundary condition (with constant flux and convective coefficient) and a heat flux from an Encore function (user subroutine). Within the domain a source term is prescribed using a sum of a constant source and an Encore function (user subroutine).

### 4.4.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 4.4.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, z) = 1 + (x - x^2)^2(y - y^2)^2(z - z^2)^2.$$

The source and heat flux user subroutines are chosen so that the solution satisfies the heat equation with the correct boundary conditions.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

## 4.5. STEADY HEX27 CONTACT

This problem tests basic steady state heat conduction in a 3D domain. The geometry consists of a unit cube. A variety of different source terms and boundary conditions are simultaneously applied. The exact solution is a manufactured solution.

### 4.5.1. Features Tested

Basic heat conduction on Hex27 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 4.5.2. Boundary Conditions

At surfaces 4 and 6, the temperature is prescribed as a constant value. On surfaces 3 and 5, a heat flux condition is prescribed using a sum of a constant heat flux and a heat flux from an Encore function (user subroutine). On surfaces 1 and 2, heat flux condition is prescribed using a sum of a convective flux boundary condition (with constant flux and convective coefficient) and a heat flux from an Encore function (user subroutine). Within the domain a source term is prescribed using a sum of a constant source and an Encore function (user subroutine).

### 4.5.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 4.5.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, z) = 1 + (x - x^2)^2(y - y^2)^2(z - z^2)^2.$$

The source and heat flux user subroutines are chosen so that the solution satisfies the heat equation with the correct boundary conditions.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

For input decks see Appendix [12.3.5](#).

### 4.10. TRANSIENT TET4TET10 CONTACT

This problem tests basic transient heat conduction with contact in a 3D domain. The geometry consists of two halves of a unit cube meshed with Tet10 elements. The problem is solved using Tet4 interpolation and applying thermal contact at the common interface between the two domains.

#### 4.10.1. Features Tested

Basic heat conduction on Tet10 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

## 4.10.2. Boundary Conditions

Using a manufactured solution, Dirichlet boundary conditions are applied on all the non-contact exposed faces.

## 4.10.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

## 4.10.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, z, t) = (x - x^2)^2 (y - y^2)^2 (z - z^2)^2 m(t) + 1,$$
$$m(t) = 10^4 [1. - \exp(-t) + t * \exp(-(t - 1.0) * (t - 1.0))];$$

The source and heat flux user subroutines are chosen so that the solution satisfies the heat equation with the correct boundary conditions.

Coarse Mesh

Error Norms

## 4.11. TRANSIENT TET10 CONTACT

This problem tests basic transient heat conduction with contact in a 3D domain. The geometry consists of two halves of a unit cube meshed with Tet10 elements. The problem is solved by applying thermal contact at the common interface between the two domains.

### 4.11.1. Features Tested

Basic heat conduction on Tet10 meshes; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 4.11.2. Boundary Conditions

Using a manufactured solution, Dirichlet boundary conditions are applied on all the non-contact exposed faces.

### 4.11.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 4.11.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, z, t) = (x - x^2)^2 (y - y^2)^2 (z - z^2)^2 m(t) + 1,$$

$$m(t) = 10^4 [1. - \exp(-t) + t * \exp(-(t - 1.0) * (t - 1.0))];$$

The source and heat flux user subroutines are chosen so that the solution satisfies the heat equation with the correct boundary conditions.

For input decks see Appendix [12.3.11](#).

## 4.12. TRANSIENT HEX8 TIED CONTACT

This problem tests transient heat conduction on a 3D domains with a nonconformal mesh between two blocks. Tied temperature (generalized contact) is used for matching the energy equation between nonconformal blocks. The geometry consists of a unit cube.

### 4.12.1. Features Tested

Transient heat conduction on Hex8 meshes; dirichlet, heat flux, and convective flux boundary conditions, Tied Contact, Nonconformal; constant source terms; heat flux and source term from Encore user subroutines.

### 4.12.2. Boundary Conditions

At surfaces 4 and 6, the temperature is prescribed as a constant value. On surfaces 3 and 5, a heat flux condition is prescribed using a sum of a constant heat flux and a heat flux from an Encore function

(user subroutine). On surfaces 1 and 2, heat flux condition is prescribed using a sum of a convective flux boundary condition (with constant flux and convective coefficient) and a heat flux from an Encore function (user subroutine). Within the domain a source term is prescribed using a sum of a constant source and an Encore function (user subroutine). On the two interior surfaces connecting the nonconformal blocks (surfaces 7 and 8), a contact definition is defined as tied temperature.

### 4.12.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 4.12.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, z, t) = (x - x^2)^2 (y - y^2)^2 (z - z^2)^2 m(t) + 1,$$

$$m(t) = 10^4 (1 - \exp(-t) + t \exp(-(t - 1)^2))$$

The source and heat flux user subroutines are chosen so that the solution satisfies the heat equation with the correct boundary conditions.

For each mesh, the errors in the temperature solution at final time are computed in the  $L^2$  norm of  $T$  and  $\dot{T}$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, 2 and 1, respectively (within a tolerance).

## 4.13. TRANSIENT TET4 TIED CONTACT

This problem tests transient heat conduction and tied thermal contact in a 3D domain as in Section 2.7. The geometry consists of a unit cube that is split along the plane at  $x = 0.5$ .

### 4.13.1. Features Tested

Basic transient heat conduction on Tet4 meshes; non-conformal tied thermal contact; dirichlet, heat flux, and convective flux boundary conditions; constant source terms; heat flux and source term from Encore user subroutines.

### 4.13.2. Boundary Conditions

Identical to Section 2.7.

### 4.13.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 4.13.4. Verification of Solution

A manufactured solution is chosen as in Section 2.7.

For each mesh, the errors in the temperature solution at final time are computed in the  $L^2$  norm of  $T$  and  $\dot{T}$ ,  $L^\infty$  and  $H^1$  norms. We see convergence rates for  $\dot{T}$  that are slightly greater than two.

# 5. ELEMENT DEATH

## 5.1. CDFEM ELEMENT DEATH (HEAT FLUX)

This problem tests transient conduction and CDFEM element death using 2D and 3D domains. The geometry consists of a thick 1/4 cylindrical or 1/8 spherical shell.

### 5.1.1. Features Tested

Transient heat conduction, adaptive second order time integration (BDF2), CDFEM element death, temperature and heat flux boundary conditions, Tri3 and Tet4 meshes.

### 5.1.2. Boundary Conditions

On one surface, the exact solution is used to specify a time-varying temperature. At the other surface, an analytic heat flux is applied using the exact solution. The erosion of the volume from CDFEM element death causes the surface with the heat flux BC to gradually recede as the material is removed.

### 5.1.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 5.1.4. Verification of Solution

A manufactured solution  $T$  and exact source term  $S$  are chosen in 2D to be:

$$T(r, t) = \frac{\ln(r)}{\ln(2-t)}, \quad S(r, t) = \frac{\ln(r)}{(\ln(2-t))^2(2-t)}$$

and in 3D to be:

$$T(r, t) = (1+t)/r, \quad S(r, t) = 1/r.$$

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms over the volume, and in the  $L^2$  and  $L^\infty$  norms over the outer surface. The test passes, only if the observed

rates of convergence in these norms are one (within a tolerance). First order convergence is expected in this case, due to the nature of the coupling of the CDFEM mesh decomposition and the heat conduction solve.

### 5.1.5. Results: Tri3

## 5.2. 3D SPHERICAL SHELL ENCLOSURE

### 5.2.1. Problem Description

This problem tests transient conduction, enclosure radiation, and CDFEM element death. The initial geometry of this problem is a hollow sphere (block 2) inside and in contact with a second hollow sphere (block 1). The geometry is such that the solution maintains radial symmetry. The inner sphere decomposes at a specific failure temperature, resulting in a changing enclosure geometry.

### 5.2.2. Features Tested

Transient heat conduction, enclosure radiation, CDFEM element death, Tet4 meshes.

### 5.2.3. Boundary and Initial Conditions

The initial condition is a piecewise steady state temperature distribution defined below in (5.1). The boundary conditions specify the temperature  $T_4$  at the outer surface (4) of the outer sphere and  $T_1$  at the inner surface (1) of the inner sphere. The inner temperature  $T_1$  will be gradually increased, while  $T_4$  remains constant in time.

An enclosure is defined initially using the outer surface of the inner volume (surface 2 of block 2) and the inner surface of the outer volume (surface 3 of block 1). The erosion of the inner volume (block 2) from CDFEM element death causes surface 2 to gradually recede as the material within block 2 is removed.

Dimensions are defined in Table 5.2-1.

**Table 5.2-1.. Dimensions of problem**

|                     |       |      |
|---------------------|-------|------|
| radius of surface_1 | $r_1$ | 0.01 |
| radius of surface_2 | $r_2$ | 0.02 |
| radius of surface_3 | $r_3$ | 0.03 |
| radius of surface_4 | $r_4$ | 0.04 |

### 5.2.4. Material Parameters

Material properties are shown in Table 5.2-2.

**Table 5.2-2.. Material properties**

|                               |              |                  |
|-------------------------------|--------------|------------------|
| Thermal conductivity          | $\kappa$     | 1.0              |
| Density                       | $\rho$       | 7682.0           |
| Specific heat                 | $C_p$        | 10.0             |
| emissivity (inner)            | $\epsilon_2$ | 0.6              |
| emissivity (outer)            | $\epsilon_3$ | 0.7              |
| Stefan-Boltzmann constant     | $\sigma$     | 5.6704e-8        |
| failure temperature (block 2) | $T_c$        | 867.011674920813 |

### 5.2.5. Verification of Solution

The solution after failure occurs is specified using inner and outer temperature solutions of the form:

$$T_i(r) \equiv T_1 + (T_c - T_1) \frac{1/r - 1/r_1}{1/r_2 - 1/r_1}, \quad r_1 \leq r \leq r_2, \quad (5.1)$$

$$T_o(r) \equiv C_o + (T_4 - C_o) \frac{1/r - 1/r_3}{1/r_4 - 1/r_3}, \quad r_3 \leq r \leq r_4 \quad (5.2)$$

Here all parameters are known except  $r_2$  and  $C_o$ , which will vary with time. The initial value of  $r_2$  is given in Table 5.2-1; the initial value of  $C_o$  is chosen to satisfy the enclosure radiation equilibrium equations below.

To complete the solution, we now derive a system of two nonlinear equations to solve for  $r_2$  and  $C_o$ . These are the energy balances on the outer and inner enclosure surfaces, given by

$$R_2 \equiv q_2 - \sigma \epsilon_2 T_2^4 + \epsilon_2 (F_{22} J_2 + F_{23} J_3) \quad (5.3)$$

$$R_3 \equiv -q_3 - \sigma \epsilon_3 T_3^4 + \epsilon_3 (F_{32} J_2 + F_{33} J_3) \quad (5.4)$$

where the three terms in each equation represent fluxes from conduction, radiative emission, and radiative reflection. The conductive fluxes are defined by Fourier's law as

$$q_2 = -\kappa_2 \frac{\partial T_i}{\partial r} \Big|_{r=r_2} = \kappa_2 \frac{T_c - T_1}{r_1^2 (1/r_2 - 1/r_1)} \quad (5.5)$$

$$q_3 = -\kappa_3 \frac{\partial T_o}{\partial r} \Big|_{r=r_3} = \kappa_3 \frac{T_4 - C_o}{r_3^2 (1/r_4 - 1/r_3)} \quad (5.6)$$

The surface temperatures are

$$T_2 \equiv T_i|_{r=r_2} = T_c, \quad T_3 \equiv T_o|_{r=r_3} = C_o$$

The radiosities are obtained by solving the linear system for enclosure radiation

$$\begin{bmatrix} 1 - (1 - \epsilon_2)F_{22} & -(1 - \epsilon_2)F_{23} \\ -(1 - \epsilon_3)F_{32} & 1 - (1 - \epsilon_3)F_{33} \end{bmatrix} \begin{bmatrix} J_2 \\ J_3 \end{bmatrix} = \begin{bmatrix} \sigma \epsilon_2 T_2^4 \\ \sigma \epsilon_3 T_3^4 \end{bmatrix}$$

to obtain

$$\begin{bmatrix} J_2 \\ J_3 \end{bmatrix} = \frac{1}{a} \begin{bmatrix} 1 - (1 - \epsilon_3)F_{33} & (1 - \epsilon_2)F_{23} \\ (1 - \epsilon_3)F_{32} & 1 - (1 - \epsilon_2)F_{22} \end{bmatrix} \begin{bmatrix} \sigma \epsilon_2 T_2^4 \\ \sigma \epsilon_3 T_3^4 \end{bmatrix}$$

where  $a$  is the determinant

$$a = (1 - (1 - \epsilon_2)F_{22})(1 - (1 - \epsilon_3)F_{33}) - (1 - \epsilon_2)F_{23}(1 - \epsilon_3)F_{32}$$

The viewfactor coefficients  $F_{ij}$  are given by

$$F_{22} = 0, \quad F_{23} = 1, \quad F_{32} = (r_2/r_3)^2, \quad F_{33} = 1 - F_{32}$$

The specific function we choose for  $T_1(t)$  is

$$T_1(t) \equiv T_1 + 400(1 - \cos(\pi t))/2$$

The time histories of  $r_2$  and  $C_o$  are shown in Figure 5.2-1.

In order to derive the source term, the time derivatives of  $r_2$  and  $C_o$  are computed once the pair of nonlinear equations is solved using Newton's method. Since the spatial part of the piecewise solution is

**Figure 5.2-1.. Evolution of parameters  $r_2$  and  $C_o$ .**

harmonic, the source terms become just  $\rho c_p \partial_t T$ , where

$$\partial_t T_i \equiv \dot{T}_1 + (T_c - \dot{T}_1) \frac{1/r - 1/r_1}{1/r_2 - 1/r_1} + (T_c - T_1) \frac{\dot{r}_2(1/r - 1/r_1)}{r_2^2(1/r_2 - 1/r_1)^2}, \quad r_1 \leq r \leq r_2, \quad (5.7)$$

$$\partial_t T_o \equiv \dot{C}_o \left(1 - \frac{1/r - 1/r_3}{1/r_4 - 1/r_3}\right), \quad r_3 \leq r \leq r_4 \quad (5.8)$$

## 5.2.6. Results

Results are presented running the problem on three meshes up to time  $t = 0.9$ .

**Table 5.2-3.. Convergence Rates at  $t = 0.9$**

| Num Dofs | $L^2(T)$ | $L^2(\dot{T})$ | $L^\infty$ | $H^1$ |
|----------|----------|----------------|------------|-------|
| 4289     | 2.09     | 1.93           | 0.96       | 1.06  |
| 25590    | 2.26     | 1.61           | 1.21       | 1.05  |

For input decks see Appendix [12.4.2](#).

## 5.3. STANDARD ELEMENT DEATH (HEAT FLUX)

This problem tests transient conduction with standard element death on a 2D square domain than is essentially a 1D problem.

Coarse Mesh

Error Norms ( $t = 0.9$ )

### 5.3.1. Features Tested

Transient heat conduction, adaptive second order time integration (BDF2), standard element death, temperature and heat flux boundary conditions, Tri3, Hex8 and Quad4 meshes.

### 5.3.2. Boundary Conditions

On one surface, the exact solution is used to specify a time-varying temperature. At the other surface, an analytic heat flux is applied using the exact solution. The erosion of the volume from element death causes the surface with the heat flux BC to recede element by element as the material is removed.

### 5.3.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 5.3.4. Verification of Solution

A manufactured solution  $T$  and exact source term  $S$  are chosen to be:

$$T(r, t) = \exp(t - x).$$

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms over the area. The test passes, only if the observed rates of convergence in these norms are one (within a tolerance). First order convergence is expected in this case.

5.3.5. Results: 1D Hex8

| 40       | 1.18 | 1.07 | 1.28 |
| 72       | 1.12 | 1.06 | 1.17 |
| 136      | 1.12 | 1.09 | 1.16 |

### 5.3.10. Boundary Conditions

On one surface, the exact solution is used to specify a time-varying temperature. On the other surfaces, the exact source solution is provided as the flux boundary condition. The erosion of the volume from element death is caused by having a minimum nodal value of temperature less than 1.

### 5.3.11. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

### 5.3.12. Verification of Solution

A manufactured solution  $T$  and exact source term  $S$  are chosen to be:

$$T(r, t) = \ln(\sqrt{x^2 + y^2})(1/\ln(2 - t)).$$

**Figure 5.3-3.. Element Death (Heat Flux): Tri3**

**Table 5.3-3.. Element Death (Heat Flux): Convergence Rates for Tri3**

| Num Dofs | Var1 | Var2 | Var3 |
|----------|------|------|------|
| 28       | nan  | nan  | nan  |
| 45       | 1.48 | 1.41 | 1.70 |
| 80       | 1.13 | 1.01 | 1.19 |
| 144      | 1.13 | 1.07 | 1.20 |

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms over the area. The test passes, only if the observed rates of convergence in these norms are one (within a tolerance). First order convergence is expected in this case.

### 5.3.13. Results: 3D Hex8

This problem evaluates transient conduction with standard element death on a 3D quarter of a hollow sphere geometry.

### 5.3.14. Features Tested

Transient heat conduction, fixed first order time integration, standard element death, Hex8 mesh.

**Figure 5.3-4.. Element Death (Heat Flux): Quad4**

**Table 5.3-4.. 2D Element Death (Heat Flux): Convergence Rates for Quad4**

| Num Dofs | Var1 | Var2 | Var3 | Var4 | Var5 |

| 84       | 1.56 | 1.37 | 1.97 | 1.50 | 1.48 |
| 246      | 1.79 | 1.62 | 2.02 | 1.30 | 1.29 |
| 810      | 1.33 | 1.25 | 1.45 | 1.17 | 1.16 |
| 2898     | 1.05 | 1.02 | 1.11 | 1.09 | 1.09 |

### 5.3.15. Boundary Conditions

On surface 2, the exact solution is used to specify a time-varying temperature. On all remaining surfaces, a heat flux boundary condition is imposed with a flux time function specified. The erosion of the volume from element death is caused by having a maximum nodal value of temperature greater than 1.

### 5.3.16. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks.

5.3.17. Verification of Solution

A manufactured solution  $T$  and exact source term  $S$  are chosen to be:

$$T(r,t) = \frac{1+t}{\sqrt{x^2+y^2+z^2}}.$$

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms over the area. The observed rates of convergence in these norms are one (within a tolerance). First order convergence is expected in this case.

Figure 5.3-5.. Element Death (Heat Flux): Hex8

## 6. TIME INTEGRATION

### 6.1. ADAPTIVE TIME INTEGRATION

This problem tests the various implicit time integrators using both fixed and adaptive time stepping. The integrators are first order (Backward Euler), second order (Crank-Nicolson) and BDF2. The geometry is a 2D square.

#### 6.1.1. Features Tested

Transient heat conduction, time integrators, adaptive time stepping, polynomial temperature dependence of density and thermal conductivity.

#### 6.1.2. Boundary Conditions

The boundary conditions are prescribed at the nodes using the analytic solution. The initial condition is specified using an Encore function evaluated at the nodes.

#### 6.1.3. Material Parameters

The specific heat is constant. The density and thermal conductivity are linear polynomials in the temperature.

#### 6.1.4. Verification of Solution

A manufactured solution is chosen as

$$T(x, y, t) = \sin(C_1 t) + 2x \cos(C_2 t) + 3y \sin(C_3 t) + 4xy \cos(C_4 t) + 5x^2 \sin(C_5 t) + 6y^2 \cos(C_6 t)$$

which requires a source term. This solution is designed to have a non-trivial time-dependence using constants:

$$C_1 = \pi, \quad C_2 = 2\pi, \quad C_3 = 3\pi, \quad C_4 = \pi, \quad C_5 = 2.5\pi, \quad C_6 = 0.5\pi$$

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The  $L^2$  error in the temperature time derivative is also computed. The test passes, only if the observed rates of convergence in these norms are 1 for  $H^1$  and 2 for all other norms (within a tolerance).

Because the adaptive meshes use less time steps, we use time step size instead of mesh size for estimation of the convergence rates. We also include the  $L^2$  error in the time derivative of the temperature.

For input decks see Appendix [12.5.1](#).

# 7. ENCLOSURE RADIATION

## 7.1. 2D CYLINDRICAL SHELL ENCLOSURE

### 7.1.1. Problem Description

This problem tests steady state coupled conduction and enclosure radiation. The geometry of this problem is a hollow cylinder (block 2) inside a second hollow cylinder (block 1), which is a radially symmetric problem.

### 7.1.2. Features Tested

Basic heat conduction, enclosure radiation, Quad4/Tri3 meshes.

### 7.1.3. Boundary Conditions

The boundary conditions specify the temperature of the outer surface of the outer sphere ( $T(r_4) = T_4$ ) and the inner surface of the inner sphere ( $T(r_1) = T_1$ ).

The problem is steady state but is initialized with a constant temperature of 300 in both blocks. The inner surface temperature  $T_1$  is set to 300. The outer surface temperature  $T_4$  is set to 1300.

Dimensions are defined in Table 7.1-1.

**Table 7.1-1.. Dimensions of problem**

|                     |       |      |
|---------------------|-------|------|
| radius of surface_1 | $r_1$ | 0.01 |
| radius of surface_2 | $r_2$ | 0.02 |
| radius of surface_3 | $r_3$ | 0.03 |
| radius of surface_4 | $r_4$ | 0.04 |

### 7.1.4. Material Parameters

Material properties are shown in Table 7.1-2.

**Table 7.1-2.. Material properties**

|                                |              |           |

| Density                        | $\rho$       | 1.0       |
| Specific heat                  | $C_p$        | 1.0       |
| emissivity (surface_2)         | $\epsilon_2$ | 0.50      |
| emissivity (surface_3)         | $\epsilon_3$ | 0.55      |
| Stefan-Boltzmann constant      | $\sigma$     | 5.6704e-8 |

### 7.1.5. Verification of Solution

In cylindrical coordinates, the temperature is independent of  $\theta$  and  $z$ . Integrating this equation twice with respect to the radius  $r$ , we obtain the general solution in either hollow cylinder to be

$$T(r) = C_1 \log(r) + C_2,$$

for arbitrary constants  $C_1$  and  $C_2$ . We will use  $r_i, i = 1, \dots, 4$  to denote the location of the four surfaces of constant  $r$ , numbered from inside to outside. Unless specified otherwise, we will use these subscripts for other quantities which are evaluated at one of the four surfaces.

Including the boundary conditions into the solution allows us to eliminate two constants and gives

$$T_{inner}(r) = T_1 + c_I \log(r/r_1) \text{ for } r_1 < r < r_2 \quad (7.1)$$

$$T_{outer}(r) = T_4 + c_O \log(r/r_4) \text{ for } r_3 < r < r_4 \quad (7.2)$$

To solve for  $c_I$  and  $c_O$  we compute the temperatures at the enclosure surfaces  $r_2$  and  $r_3$ , defined as  $T_2 = T_{inner}(r_2)$  and  $T_3 = T_{outer}(r_3)$ :

### 7.1.6. Results

The exact temperatures at the enclosure surfaces (to six digits precision) are  $T_2 = 444.7977$  and  $T_3 = 956.5915$ . From these values we can compute the values of  $c_O$  and  $c_I$  and thus the exact solution.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

These optimal rates are observed in this test.

For input decks see Appendix [12.6.1](#).

**Figure 7.1-1.. Enclosure Radiation 2D**

## 7.2. 2D ANNULAR ENCLOSURE

### 7.2.1. Problem Description

This problem tests steady state coupled conduction and enclosure radiation. The geometry is an annulus with a crack.

### 7.2.2. Features Tested

Basic heat conduction, enclosure radiation, Tri3 mesh.

### 7.2.3. Boundary Conditions

The outer and crack boundary conditions are prescribed at the nodes using the analytic solution. The inner boundary uses an enclosure boundary condition.

## 7.2.4. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant.

## 7.2.5. Verification of Solution

The manufactured solution is

$$\begin{aligned}
 J(\theta) &= k_1 + k_2 \sqrt{\varepsilon} \cos\left(\frac{\sqrt{\varepsilon}\theta}{2}\right) / \sin\left(\sqrt{\frac{\varepsilon}{\pi}} 2\right), \\
 H(\theta) &= k_1 + k_2 \left(\frac{\sqrt{\varepsilon}}{1 - \varepsilon}\right) \left(\cos\left(\frac{\sqrt{\varepsilon}\theta}{2}\right) / \sin\left(\frac{\sqrt{\varepsilon}\pi}{2}\right) - \sqrt{\varepsilon} \cos\left(\frac{\theta}{2}\right)\right), \\
 q(\theta) &= J(\theta) - H(\theta), \\
 \beta(\theta) &= \left(\frac{k_1 + k_2 \cos\left(\frac{\theta}{2}\right)}{\sigma}\right)^{1/4}, \\
 T(r, \theta) &= r\beta(\theta) + (r - r_{\text{cyl}}) \left(\frac{q(\theta)}{\kappa} - \beta(\theta)\right),
 \end{aligned}$$

where  $J$  is the radiosity,  $H$  is the irradiance,  $q$  is the flux, and

$$\begin{aligned}
 \sigma &= 5.6704 \times 10^{-8}, \\
 \kappa &= 1, \\
 r_{\text{cyl}} &= 1, \\
 \varepsilon &= 0.9, \\
 k_1 &= 8000, \\
 k_2 &= 400.
 \end{aligned}$$

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance). Additionally, the errors in the radiosity and irradiance are computed in the  $L^2$  norms and be 1 (within a tolerance).

These optimal rates are observed in this test.

For input decks see Appendix [12.6.2](#).

## 7.3. 3D SPHERICAL SHELL ENCLOSURE

### 7.3.1. Problem Description

This problem tests steady state coupled conduction and enclosure radiation. The geometry of this problem is a hollow sphere (block 2) inside a second hollow sphere (block 1), which is a radially symmetric problem.

### 7.3.2. Features Tested

Basic heat conduction, enclosure radiation, Hex8 meshes.

### 7.3.3. Boundary Conditions

The boundary conditions specify the temperature of the outer surface of the outer sphere ( $T(r_4) = T_4$ ) and the inner surface of the inner sphere ( $T(r_1) = T_1$ ).

The problem is steady state but is initialized with a constant temperature of 300 in both blocks. The inner surface temperature  $T_1$  is set to 300. The outer surface temperature  $T_4$  is set to 1300.

Dimensions are defined in Table 7.3-1.

**Table 7.3-1.. Dimensions of problem**

|                     |       |      |
|---------------------|-------|------|
| radius of surface_1 | $r_1$ | 0.01 |
| radius of surface_2 | $r_2$ | 0.02 |
| radius of surface_3 | $r_3$ | 0.03 |
| radius of surface_4 | $r_4$ | 0.04 |

### 7.3.4. Material Parameters

Material properties are shown in Table 7.3-2.

**Table 7.3-2.. Material properties**

|                                |              |           |
|--------------------------------|--------------|-----------|
| Thermal conductivity (block_1) | $\kappa_1$   | 2.0       |
| Thermal conductivity (block_2) | $\kappa_2$   | 0.35      |
| Density                        | $\rho$       | 1.0       |
| Specific heat                  | $C_p$        | 1.0       |
| emissivity (surface_2)         | $\epsilon_2$ | 0.50      |
| emissivity (surface_3)         | $\epsilon_3$ | 0.55      |
| Stefan-Boltzmann constant      | $\sigma$     | 5.6704e-8 |

### 7.3.5. Verification of Solution

In spherical coordinates, the temperature is independent of  $\theta$  and  $\phi$ . Integrating this equation twice with respect to the radius  $r$ , we obtain the general solution in either hollow sphere to be

$$T(r) = C_1 r^{-1} + C_2,$$

for arbitrary constants  $C_1$  and  $C_2$ . We will use  $r_i, i = 1, \dots, 4$  to denote the location of the four surfaces of constant  $r$ , numbered from inside to outside. Unless specified otherwise, we will use these subscripts for other quantities which are evaluated at one of the four surfaces.

Including the boundary conditions into the solution allows us to eliminate two constants and gives

$$T_{inner}(r) = T_1 + c_I \left( \frac{1}{r} - \frac{1}{r_4} \right) \text{ for } r_1 < r < r_2 \quad (7.3)$$

$$T_{outer}(r) = T_4 + c_O \left( \frac{1}{r} - \frac{1}{r_1} \right) \text{ for } r_3 < r < r_4 \quad (7.4)$$

To solve for  $c_I$  and  $c_O$  we compute the temperatures at the enclosure surfaces  $r_2$  and  $r_3$ , defined as  $T_2 = T_{inner}(r_2)$  and  $T_3 = T_{outer}(r_3)$ :

$$T_2 = T_1 + c_I \left( \frac{1}{r_2} - \frac{1}{r_4} \right) \quad (7.5)$$

$$T_3 = T_4 + c_O \left( \frac{1}{r_3} - \frac{1}{r_1} \right) \quad (7.6)$$

The fluxes at the surfaces between the two hollow spheres are

$$q_2 = \left( -\kappa \frac{\partial T}{\partial r} \Big|_{r=r_3} \right) \cdot \mathbf{n} = \frac{\kappa_1 c_I}{r_2^2}$$

$$q_3 = \left( -\kappa \frac{\partial T}{\partial r} \Big|_{r=r_2} \right) \cdot \mathbf{n} = \frac{\kappa_2 c_O}{r_3^2}$$

Here we have used  $\kappa_1$  and  $\kappa_2$  to denote the thermal conductivity of the inner and outer blocks, respectively.

These normal conductive fluxes are included in the total energy balance at the enclosure surfaces using the radiative transport equations (for grey diffuse surfaces):

$$q_2 = \sigma \epsilon_2 T_2^4 - \epsilon_2 \sum_j F_{2j} J_j$$

$$q_3 = \sigma \epsilon_3 T_3^4 - \epsilon_3 \sum_j F_{3j} J_j$$

where  $\sigma$  is the Stefan Boltzmann constant,  $\epsilon$  is the emissivity,  $F_{ij}$  is the geometric viewfactor of surface  $i$  with respect to surface  $j$  and  $J_j$  is the radiosity for surface  $j$ .

The viewfactor coefficient  $F_{ij}$  is the fraction of energy that leaves surface  $i$  and arrives at surface  $j$ . For this geometric setup, no point on the inner surface at  $r_2$  can “see” itself (no straight line can be drawn from a point on its surface onto itself) and so  $F_{22} = 0$ . By viewfactor reciprocity

$$\sum_j F_{ij} = 1$$

we must have  $F_{23} = 1$ . The outer-to-inner view factor  $F_{32}$  can be computed analytically to be

$$F_{32} = \frac{r_2^2}{r_3^2}$$

and again by viewfactor reciprocity

$$F_{33} = 1 - F_{32} = 1 - \frac{r_2^2}{r_3^2}$$

The system of equations that must be solved for the radiosities at the inner and outer surfaces is given by

$$J_2 = \epsilon_2 \sigma T_2^4 + (1 - \epsilon_2)[F_{22}J_2 + F_{23}J_3]$$

$$J_3 = \epsilon_3 \sigma T_3^4 + (1 - \epsilon_3)[F_{32}J_2 + F_{33}J_3]$$

Solving this system of equations, we can write  $J_2$  and  $J_3$  in terms of temperature, and plug this back into the equation for the surface flux. We then get a system of two nonlinear equations to solve for  $T_2$  and  $T_3$ , the temperatures of the adjacent surfaces without Dirichlet boundary conditions. For our given set of parameters, these equations are solved iteratively in Matlab using the fsolve function.

### 7.3.6. Results

The exact temperatures at the enclosure surfaces (to six digits precision) are  $T_2 = 564.783$  and  $T_3 = 1047.825$ . From these values we can compute the values of  $c_O$  and  $c_I$  and thus the exact solution.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

These optimal rates are observed in this test.

Figure 7.3-1.. Enclosure Radiation

## 7.4. 3D SPHERICAL SHELL PARTIAL ENCLOSURE

### 7.4.1. Problem Description

This problem tests coupled conduction and enclosure radiation with a partial enclosure. The geometry consists of two thick spherical shells separated by a gap. The outer shell has a section removed so that the enclosure is only partial.

### 7.4.2. Features Tested

Basic heat conduction, enclosure radiation with partial enclosure, Hex8 meshes.

### 7.4.3. Boundary Conditions

The outer and inner boundary conditions are prescribed at the nodes using the analytic solution. The analytic solution is used to set the boundary conditions on the cutaway face near the opening in the outer shell.

### 7.4.4. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant within each element block; however, the values differ between blocks.

## 7.4.5. Verification of Solution

The analytic solution is identical to Section 7.3. The area for the partial enclosure is computed analytically.

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 2, 2, and 1, respectively (within a tolerance).

These optimal rates are observed in this test.

## 8. CHEMISTRY

### 8.1. FIRST ORDER REACTION (SPATIALLY VARYING TEMPERATURE)

This problem tests the interface to the CHEMEQ solver under the assumption that the temperature remains variable in space but remains constant in time. The geometry consists of a unit cube meshed with Hex8 elements refined only in one direction ( $x$ ).

#### 8.1.1. Features Tested

CHEMEQ solver; source term from chemistry; nonlinear solver; second order time integrator with fixed time steps; constant initial temperature; constant temperature boundary condition.

#### 8.1.2. Boundary Conditions

A constant temperature is applied on surface 1. The initial temperature is provided by an Encore user subroutine and the initial species values are  $A = 1$  and  $B = 0$ .

#### 8.1.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks. The CHEMEQ parameters are chosen to model a single first order reaction  $A \rightarrow B$  with constant values of pre-exponential factor and activation energy.

#### 8.1.4. Verification of Solution

A manufactured solution is chosen as

$$\begin{aligned}T(x) &= 400 (1 + 0.2 \cos(\pi x)), \\A(x, t) &= \exp \left\{ -\exp(5) \exp\left(-\frac{1000}{RT(x)}\right) t \right\}, \\B(x, t) &= 1 - A(x, t)\end{aligned}$$

where  $R = 1.9872$  is the ideal gas constant. A source term is used to insure that the temperature does not vary in time.

For each mesh, the errors in the temperature and species  $A$  and  $B$  are computed in the  $L^2$  norm. The test passes, only if the observed rates of convergence in these norms are 2 (within a tolerance).

**Figure 8.1-1.. First Order Reaction (Spatially Varying Temperature)**

**Table 8.1-1.. First Order Reaction (Spatially Varying Temperature): Convergence Rates for Hex8 Meshes**

| Num Dofs | $L^2(A, B)$ | $L^2(T)$ |
|----------|-------------|----------|
| 36       | 2.37        | 2.34     |
| 68       | 2.18        | 2.18     |
| 132      | 2.09        | 2.09     |
| 260      | 2.05        | 2.04     |
| 516      | 2.02        | 2.02     |

For input decks see Appendix [12.7.2](#).

## 8.2. FIRST ORDER REACTION

This problem tests the interface to the CHEMEQ solver under a temperature field that is variable in space and time. The geometry consists of a unit cube meshed with Hex8 elements refined only in one direction.

### 8.2.1. Features Tested

CHEMEQ solver; source term from chemistry; nonlinear solver; second order time integrator with fixed time steps; initial temperature from user sub; constant temperature boundary condition.

### 8.2.2. Boundary Conditions

The initial temperature and the temperature boundary condition on surface 1 are provided by an Encore user subroutine and the initial species values are  $A = 1$  and  $B = 0$ .

### 8.2.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant, equal to one in both blocks. The CHEMEQ parameters are chosen to model a single first order reaction  $A \rightarrow B$  with constant values of pre-exponential factor and activation energy.

### 8.2.4. Verification of Solution

A manufactured solution is chosen as

$$\begin{aligned}\phi(x, t) &= \exp(a - E/(RT_0))(1 + 0.1 \sin(x)) \exp(t), \\ \Phi(x, t) &= \exp(a - E/(RT_0))(1 + 0.1 \sin(x))(\exp(t) - 1), \\ T(x, t) &= (E/R)/(a - \ln(\phi(x, t))), \\ A(x, t) &= \exp(-\Phi(x, t)), \\ B(x, t) &= 1 - A(x, t)\end{aligned}$$

where  $a$  is the log pre-exponential factor,  $R$  is the ideal gas constant,  $E$  is the activation energy, and  $T_0$  is a reference temperature value. The form of the solution is contrived so that

$$\begin{aligned}\partial_t A(x, t) &= -\partial_t B(x, t) = -\phi(x, t) A(x, t) \\ \phi(x, t) &= \exp(a) \exp\left(-\frac{E}{RT(x, t)}\right)\end{aligned}$$

This allows the chemistry ODEs to be satisfied exactly, but a source term is needed in the energy equation.

For each mesh, the errors in the temperature and species  $A$  and  $B$  are computed in the  $L^2$  norm. The test passes, only if the observed rates of convergence in these norms are 1 (within a tolerance). Currently it is not clear why the convergence rates are only first order.

For input decks see Appendix [12.7.3](#).

**Figure 8.2-1.. First Order Reaction**

## 8.3. DAE AND PRESSURE TEST

This test runs CHEMEQ with a kinetics model that includes both pressure dependence and distributed activation energy for a single element mesh with uniform temperature and pressure.

### 8.3.1. Features Tested

Basic heat conduction on a Hex8 mesh; CHEMEQ solver with pressure dependence and distributed activation energy.

### 8.3.2. Boundary Conditions

No boundary conditions are prescribed, resulting in an adiabatic flux BC.

### 8.3.3. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant.

### 8.3.4. Verification of Solution

The analytic solution for the concentration of species A as a function of time for the constant values used in this test case is

$$A(t) = \frac{1}{2} \operatorname{erfc}\left(\frac{1}{6} \left( \sqrt{2} - 6 \operatorname{erf}^{-1}\left(1 - 45t / \left(2 \exp\left(\frac{61}{18}\right)\right)\right)\right)\right)$$

The test compares the temperature errors against a gold file of the error at each time step. The exact solution for the concentration of A is also output to the exodus file and a comparison plotting that and the solved for concentration as a function of time has them lying on top of one another.

For input decks see Appendix [12.7.4](#).

## 9. MISCELLANEOUS

### 9.1. THERMAL POSTPROCESSING

#### 9.1.1. Problem Description

This problem tests basic thermal postprocessors in Aria.

#### 9.1.2. Features Tested

Basic heat conduction, thermal postprocessors, Hex8 meshes.

#### 9.1.3. Boundary Conditions

Dirichlet BCs are specified using the exact solution on surface 1. On surface 2, a natural convection BC is specified, using the exact solution as the reference temperature and a constant heat transfer coefficient. Similarly, a radiative flux BC is applied on surface 3, with constant values of emissivity and radiation form factor. A source term is applied within all blocks based on substituting the exact solution into the heat conduction operator.

#### 9.1.4. Material Parameters

The values of density, thermal conductivity, and specific heat are all constant with the same value for both blocks.

#### 9.1.5. Verification of Solution

The manufactured solution is

$$T_0 + \exp(C_0(x^2 - 1) + C_1(y^2 - 0.25) + C_2(z^2 - 0.25) + C_3t).$$

Postprocessors are computed for the integrated power output for convective and radiative BCs (cf\_bc\_ipo, rf\_bc\_ipo), the integrated flux output for convective and radiative BCs (cf\_bc\_ifo, rf\_bc\_ifo), the integrated power output for volume source terms (src\_ipo), and several point evaluations (eval\_b1, eval\_b1b2, eval\_s2).

For each mesh, the errors in the temperature solution are computed in the  $L^2$  norm and for various postprocessors. The test passes, only if the observed rates of convergence are 2 (except for the integrated power output for source terms, which convergences with order 4).

These optimal rates are observed in this test clearly in most cases. However, for the point evaluation cases, a large amount of variability exists in the convergence rates.

Figure 9.1-1.. Thermal Postprocess

| Table 9.1-1.. Thermal Postprocess: Convergence Rates |       |                  |                  |                  |                  |                |                  |                |

For input decks see [Appendix 12.8.1](#).

## 9.2. LOCAL COORDINATES: CARTESIAN

This problem tests the use of a local Cartesian coordinate system in a material model. The geometry is a 3D cube that has been rotated.

### 9.2.1. Features Tested

Steady heat conduction, time integrators, tensor thermal conductivity, local Cartesian coordinates in a material model.

### 9.2.2. Boundary Conditions

The boundary conditions are prescribed at the nodes using the analytic solution. The initial condition is specified using an Encore function evaluated at the nodes.

### 9.2.3. Material Parameters

The specific heat is constant. The density and thermal conductivity are constant, with a diagonal (tensor) thermal conductivity in the local coordinate space of the material.

### 9.2.4. Verification of Solution

A manufactured solution is chosen as

$$T(X, Y, Z) = T_0 + T_1 \cos(x_k X) \cos(y_k Y) \cos(z_k Z)$$

where  $(X, Y, Z)$  are the local material coordinates, which are related to the Cartesian coordinates  $(x, y, z)$  by a rotation matrix consisting of a product of rotations (22.5 deg around the  $z$ -axis and 45 deg around the  $x$ -axis).

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 1 for  $H^1$  and 2 for all other norms (within a tolerance).

**Table 9.2-1.. Local Cartesian Coordinate System: Convergence Rates**

| Num Dofs | $L^2$ | $L^\infty$ |
|----------|-------|------------|
| 1331     | 2.29  | 2.20       |
| 9261     | 2.15  | 2.15       |
| 68921    | 2.07  | 2.07       |

For input decks see Appendix [12.8.3](#).

## 9.3. LOCAL COORDINATES: CYLINDRICAL

This problem tests the use of a local cylindrical coordinate system in a material model. The geometry is a 3D cube that has been rotated.

**Figure 9.2-1.. Local Cartesian Coordinate System**

### 9.3.1. Features Tested

Steady heat conduction, time integrators, tensor thermal conductivity, local coordinates in a material model.

### 9.3.2. Boundary Conditions

The boundary conditions are prescribed at the nodes using the analytic solution. The initial condition is specified using an Encore function evaluated at the nodes.

### 9.3.3. Material Parameters

The specific heat and density are constant. The diagonal (tensor) components of the thermal conductivity are specified using constant values in the local coordinate space of the material.

### 9.3.4. Verification of Solution

A manufactured solution is chosen as

$$T(X, Y, Z) = T_0 + T_1(2R)^3 \cos(\theta) \cos(z_k Z)$$

where  $(R, \Theta, Z)$  are the local cylindrical material coordinates, which are related to the standard cylindrical coordinates  $(x, y, z)$  by a rotation matrix consisting of a product of rotations (22.5 deg around the  $z$ -axis and 45 deg around the  $x$ -axis).

For each mesh, the errors in the temperature solution are computed in the  $L^2$ ,  $L^\infty$  and  $H^1$  norms. The test passes, only if the observed rates of convergence in these norms are 1 for  $H^1$  and 2 for all other norms (within a tolerance).

**Figure 9.3-1.. Local Cylindrical Coordinate System**

**Table 9.3-1.. Local Cylindrical Coordinate System: Convergence Rates**

| Num Dofs | $L^2$ | $L^\infty$ |
|----------|-------|------------|
| 2692     | 2.19  | 2.19       |
| 22723    | 2.12  | 1.53       |
| 148839   | 2.07  | 1.74       |

9 ConvTaylorVortex/gfemConvTaylorVortex.test|np8
10 SteadyTaylorVortex/gfemSteadyTaylorVortex.test|np8
```

This page intentionally left blank.

# 11. HOW TO BUILD THIS DOCUMENT

You need to have Sierra developer access (through WebCars). Then you should clone the Sierra Git repository containing the tests to a location with adequate memory (currently more than 80GB), using a command like this:

```
git clone sierra-git:/git/tests
```

Then you need to assign the verification tests, running the following command from your local tests repository:

```
assign --path aria_rtest/verification
```

This will produce a text file called `assigned.tests` containing the list of all tests to run. You should edit the second line of this file to indicate the remote location (accessible from the HPC machine where you will run the tests). For example, I might have something like this:

```
# Created by assign at Fri Sep 19 09:52:09 2014
#@ /gscratch1/bcarnes/TESTS
aria_rtest/verification/1dnonlin_verify1/1dnonlin_verify1.test|np8
aria_rtest/verification/cyl_shell_2d/cyl_shell_2d.test|np8
aria_rtest/verification/cyl_shell_3d/cyl_shell_3d.test|np8
...
```

Next you need to copy the test files and the `assigned.test` file to the remote location (here it is “/gscratch1/bcarnes/TESTS/”):

```
rsync -azv aria_rtest/verification redsky:/gscratch1/bcarnes/TESTS/aria_rtest
scp assigned.tests redsky:/gscratch1/bcarnes/TESTS/
```

Here I am only copying the verification test sub-directory, since I do not want to run any other tests.

On the HPC machine, you will need to load a pre-built version of the code such as the nightly master build:

```
module load sierra/master
```

To see where the executables are located, you can run something like:

```
[bcarnes@redsky-login9 ~]$ which aria
/projects/sierra/redsky/install/master/bin/aria
```

Finally, to run the tests, you use the testrun script, with a few additional arguments. The first locates the source code needed to compile the various user subroutines (which we just found from running “which aria”), the second enables tests to run as long as needed, the third uses the queue, and the fourth saves the results so you can use them in the manual.

```
testrun --user sourcedir=/projects/sierra/tlcc2/install/master/ \
        --allow-multipliers=time \
        --queued \
        --save-all-results
```

It may take 1-2 hours to run all the tests. Note that if the tests start to fail with an error associated with the ACCOUNT not being set, you may need to set it using your WCID:

```
export ACCOUNT=fyXXXXXX
```

To view your available WCIDs, run the following command:

```
mywcid
```

To build this manual, you should clone the Sierra Git repository containing the documentation files using a command like this:

```
git clone sierra-git:/git/docs
```

Then go to the directory within your local repository containing the Aria Verification Manual files:

```
cd aria/doc/verification_manual
```

Once the tests have all ran successfully, you should sync the results from the remote location back to this directory:

```
rsync -azv redsky:/gscratch1/bcarnes/TESTS/results .
```

Then run the a script to execute any local postprocessing needed to create the plots for the tests:

```
python ariaPostprocess.py
```

Finally you can create the manual using pdflatex:

```
pdflatex Aria_Verification_Manual.tex
```

which should create a new PDF output file.

Sandia  
National  
Laboratories

Sandia National Laboratories  
is a multimission laboratory  
managed and operated by  
National Technology &  
Engineering Solutions of  
Sandia LLC, a wholly owned  
subsidiary of Honeywell  
International Inc., for the U.S.  
Department of Energy's  
National Nuclear Security  
Administration under contract  
DE-NA0003525.
