PROBABILISTIC GRID RELIABILITY ANALYSIS WITH ENERGY STORAGE SYSTEMS (PROGRESS)

An Open-Source Tool for Assessing Reliability of the Electric Power Grid

Atri Bera

Sandia National Laboratories

August 6, 2024

Presentation ID: 503

Sandia National Laboratories is a multimission laboratory managed and operated by National Technology and Engineering Solutions of Sandia LLC, a wholly owned subsidiary of Honeywell International Inc. for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525.

SAND2024-09955C

- Motivation
- Background
- Key features of ProGRESS
- Example Workflow
- Distribution

Motivation

Energy storage systems (ESS) being widely deployed for grid reliability and resilience applications

- Mitigate short- and long-term variability of renewable resources
- Serve as backup power for critical infrastructure
- Mitigate outages during extreme weather events/extended periods of black-sky conditions

Modeling and integrating storage operation and failure characteristics crucial

- Understand impact on grid reliability and resilience
- Plan effectively to achieve and maintain desired grid reliability levels

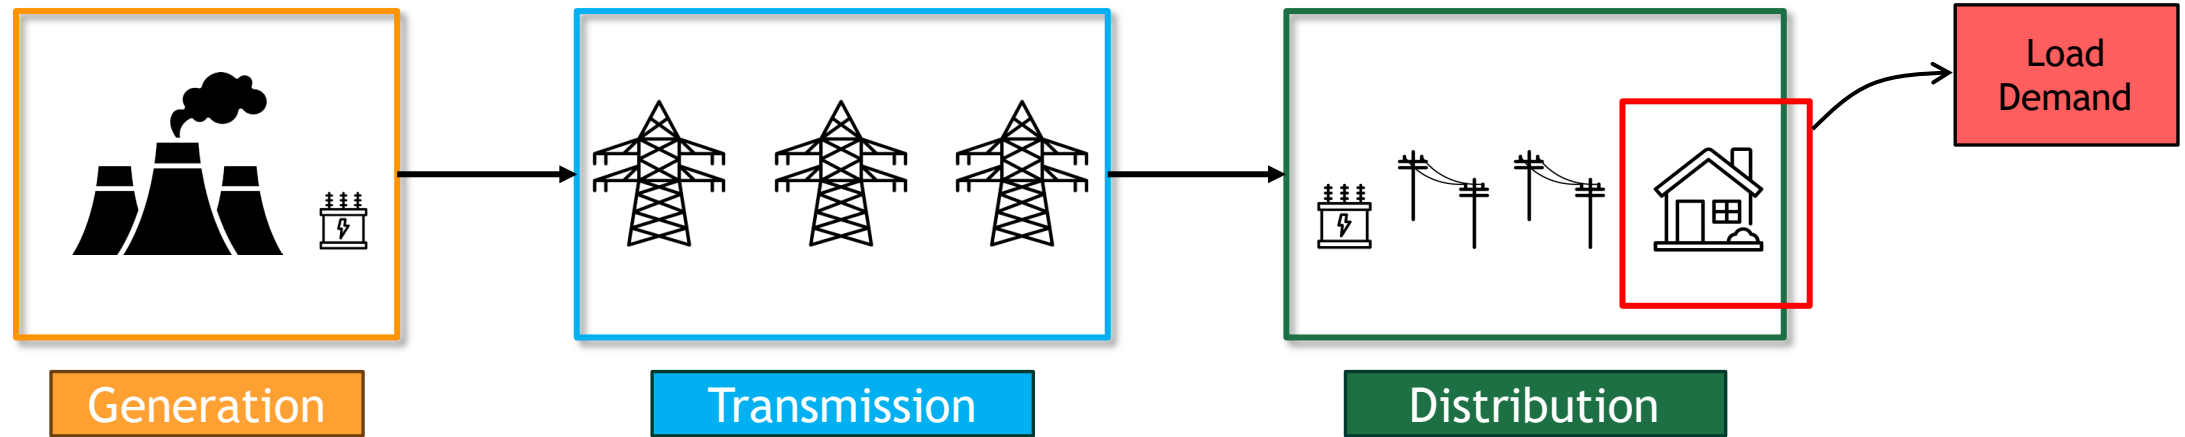

Objective: Develop grid reliability assessment tool with focus on

- ESS failure modeling
- capacity value/effective load carrying capability (ELCC) calculation of ESS
- sizing ESS for reliability applications
- valuation of ESS in enhancing grid reliability and resilience

BACKGROUND

What is Grid Reliability?

Definition: Reliability of a power system pertains to its ability to satisfy load demand under specified operating conditions and policies

Quantification: Probability and frequency of encountering failure states and the period of time system spends in failure states

Measure: Loss of Load Probability (LOLP), Loss of Load Expectation (LOLE) in days/year, Loss of Load Frequency (LOLF) in failures/year, Expected Unserved Energy (EUE) in MWh/year

What is Grid Reliability?

- Transitions in system not deterministic, can only be predicted with a certain probability – **random process**
- System components have random behavior – modeled using random variables
- **Modeling considerations:** components, dependencies of components, representation of power system such as *power flow models, operating constraints, policies and contracts*

Thermal Generators

- Two- or multi-state models
- Maximum and minimum capacity ratings
- Fuel availability
- Fixed or variable forced outage rates

Transmission Lines

- Copper sheet/zonal/nodal models
- Fixed or time-varying limits
- Line outages considered for zonal/nodal models

Energy Storage & Renewables

- Multi-state model for energy storage and renewable resources
- Operational dynamics of storage with SOC and other constraints
- Specific models for wind and solar based on their inherent characteristics

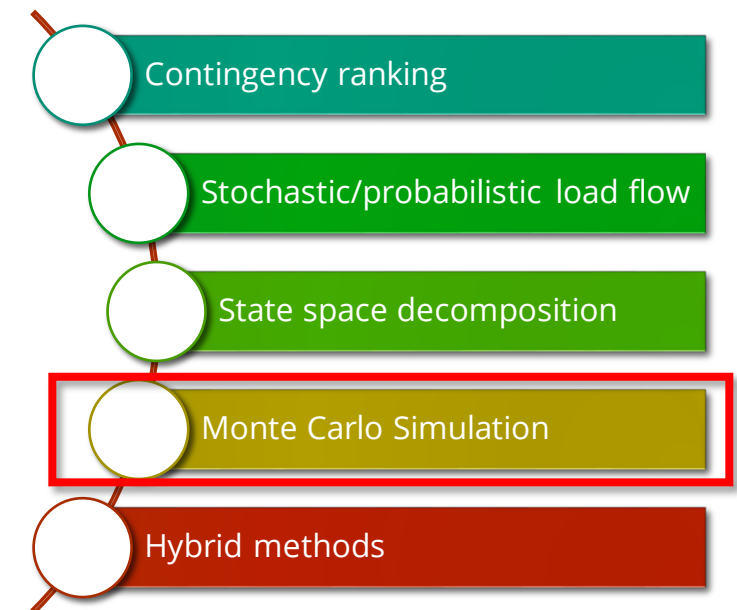

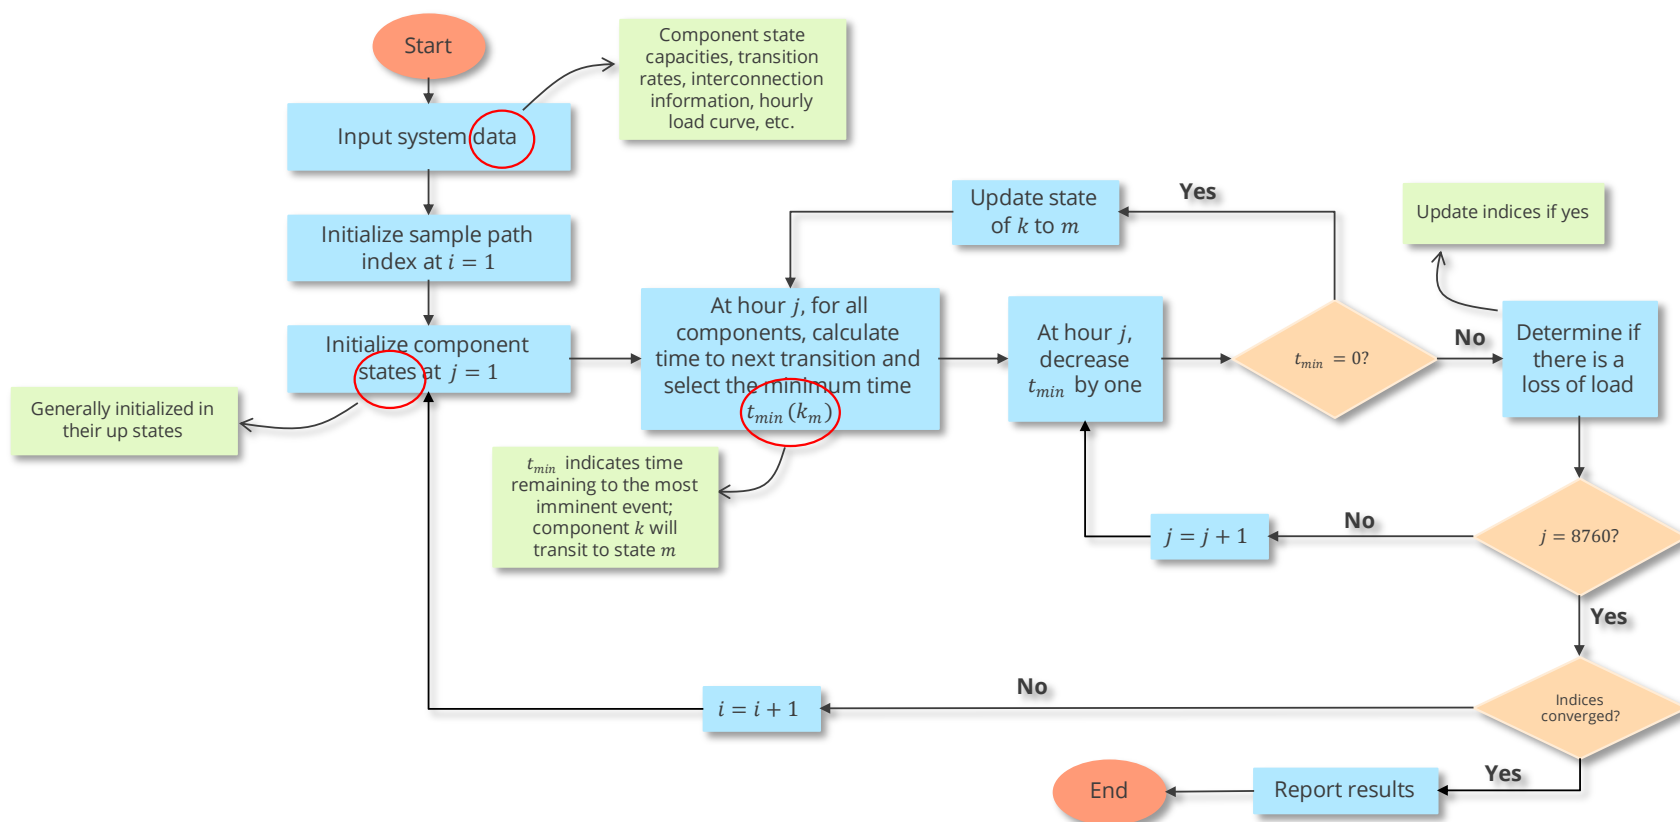

Figure: Methods used for large power systems

KEY FEATURES

Stochastic Monte Carlo Engine

The Probabilistic Grid Reliability Analysis with Energy Storage Systems (ProGRESS) software tool is a Python-based open-source tool for assessing the reliability of the evolving electric power grid integrated with energy storage systems (ESS).

- ✓ Generate samples (scenarios) with diverse weather conditions, component failures
- ✓ Sequential time-series model, enable integration of energy storage systems smooth
- ✓ Each sample is one year long (8760 hours)
- ✓ Users can choose how many samples they want to run

Figure: Mixed-time sequential Monte Carlo simulation algorithm

Enhanced Renewable Energy Modeling

Solar Data

Solar weather data (DNI, GHI, DHI, etc.) downloaded from [NSRDB](#) using API

Converted to solar power generation data using [pvlib](#) library

In-built algorithm used to cluster generation data into similar days

MCS engine picks days at random depending on the month

progress

Wind Data

Wind speed data downloaded from [WIND Toolkit](#) using API

Transition rate matrix developed

Wind speed for next hour predicted

Wind speed converted to wind power generation

Energy Storage Modeling

- All ESS are li-ion batteries
- Each ESS is made up of several sub-units
- Each sub-unit could be either a 20- or 40- feet long container housing a 2.5 MWh or 5 MWh sub-unit respectively^{1, 2}
- It is assumed that a sub-unit is the smallest unit that can fail
- ESS operates at derated state when one/more sub-unit faces outage
- Multi-state model of ESS developed
- *Operation*: ESS discharge only when there is a shortfall of generation; charge at all other times until they reach max SOC

 2. [1 MW/2.5 MWh Energy Storage System](#)

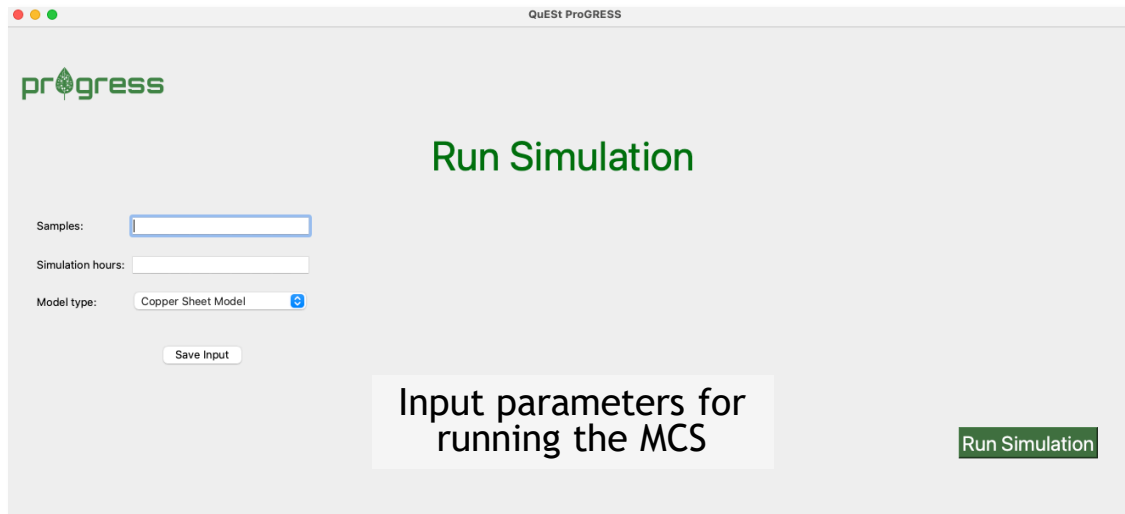

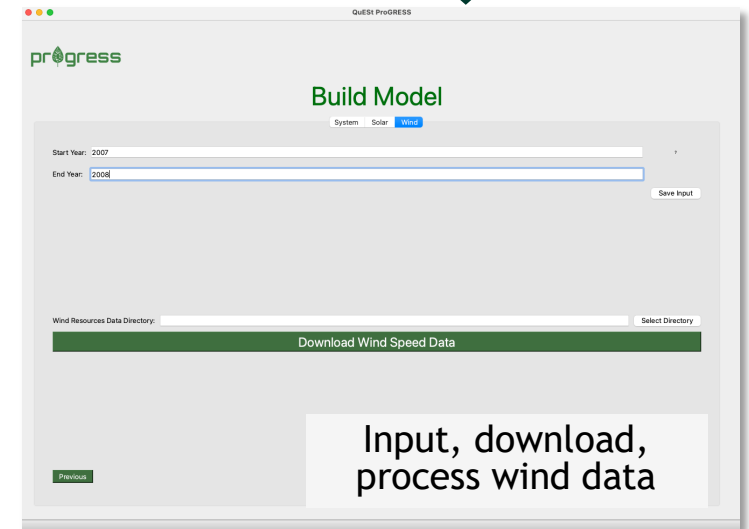

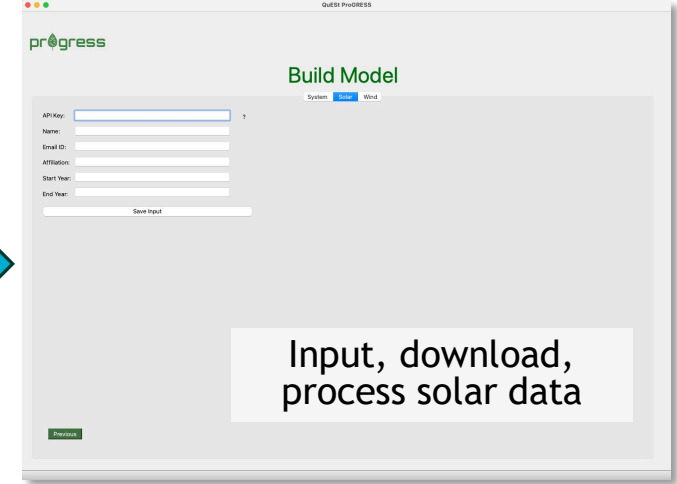

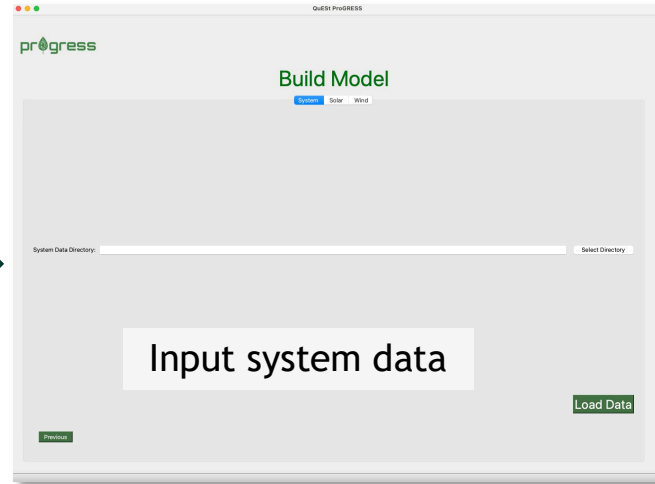

Other Key Features

Feature	Description
Modular Structure	ProGRESS developed using Object-Oriented Programming (OOP) structure with a modular design – enables users to easily modify backend programs and meet specific requirements
Model Flexibility	Power systems can be represented using a transportation or a copper-sheet model
User-friendly GUI	Interactive Graphical User Interface (GUI) simplifies the process of input data upload, model building, and results interpretation
Parallel Programming	Modules provided for parallel programming, allowing users with access to high-performance computing resources to run longer simulations with larger systems for more accurate results
Data Input	Data can be input using csv files. Standard data formats following IEEE test cases is used.

WORKFLOW

Workflow with GUI

Workflow without GUI

```
! inputyaml
snl_progress > ! inputyaml
1 # ProGRESS Configuration File
2
3 # Data file directory
4 data: "/path/to/Data/directory"
5
6 # Inputs for the API
7 api_key: "YourApiKey"
8 email: "youremail@whatever.com"
9 affiliation: 'XYZ Labs'
10 name: 'John'
11
12 # Inputs for Wind
13 year_start_w: 2007
14 year_end_w: 2014
15
16 # Inputs for Solar
17 year_start_s: 1998
18 year_end_s: 2024
19
20 # Monte Carlo simulation parameters
21 samples: 1
22 sim_hours: 8760
23 load_factor: 1.25
24 model: 'Copper Sheet' # 'Zonal' or 'Copper Sheet'
25
```

Configure inputs using .yaml file

```
example_simulation.py x
snl_progress > example_simulation.py > ...
1 import numpy (module) environ
2 from time import *
3 from pyomo.environ import *
4 import copy
5 import pandas as pd
6 import os
7 import yaml
8
9 from mod_sysdata import RASystemData
10 from mod_solar import Solar
11 from mod_wind import Wind
12 from mod_utilities import RAUtilities
13 from mod_matrices import RAMatrices
14 from mod_plot import RAPlotTools
15 from mod_kmeans import KMeans_Pipeline
16
17 def MCS(input_file):
18     '''This function performs mixed time sequential MCS using methods fr
19
20     # open configuration file
21     with open(input_file, 'r') as f:
22         config = yaml.safe_load(f)
23
24     # data file locations
25     system_directory = config['data'] + '/System'
26     solar_directory = config['data'] + '/Solar'
27     wind_directory = config['data'] + '/Wind'
28
29     # Monte Carlo simulation parameters
30     samples = config['samples']
31     sim_hours = config['sim_hours']
32
33     # system data
34     data_gen = system_directory + '/gen.csv'
35     data_branch = system_directory + '/branch.csv'
36     data_bus = system_directory + '/bus.csv'
37     data_load = system_directory + '/load.csv'
38     data_storage = system_directory + '/storage.csv'
39     BMVa = 100
```

From terminal: `python example_simulation.py`

ProGRESS allows Parallel Processing using High Performance Computers (HPC) with the 'mpi4py' library. Example scripts and bash files for running jobs are available in the repository with detailed instructions.

Example Results

Quantification of System Reliability

Index	Description
LOLP	Loss of Load Probability
LOLE	Loss of Load Expectation
MDT	Mean Down Time
nEUE	normalized Expected Unserved Energy
EPNS	Expected Power Not Served
LOLF	Loss of Load Frequency

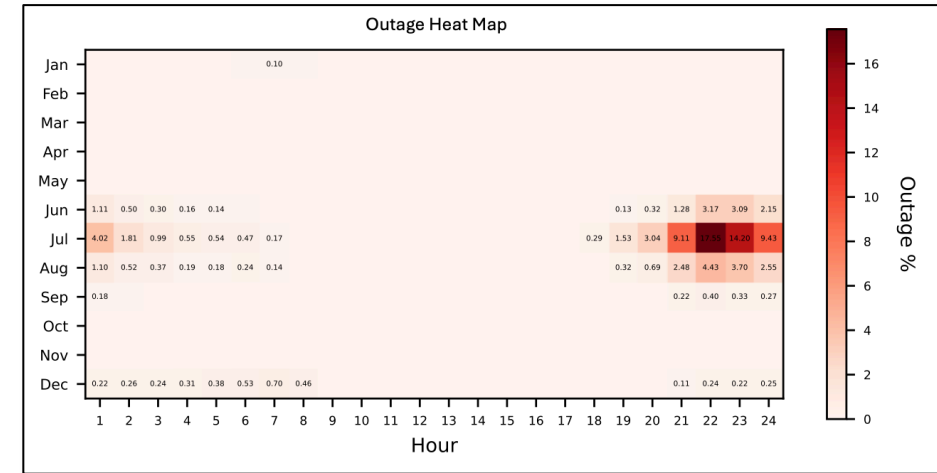

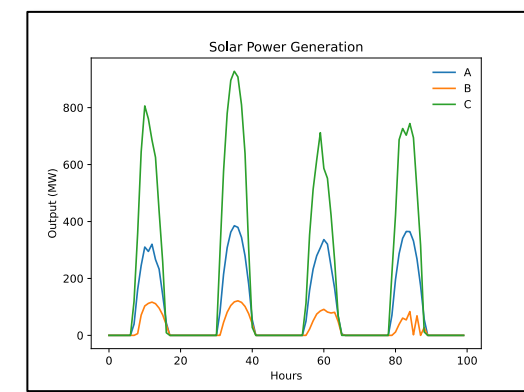

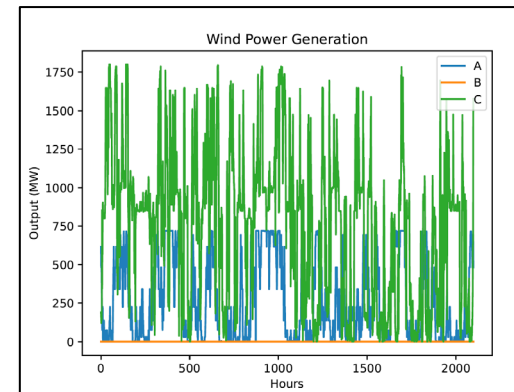

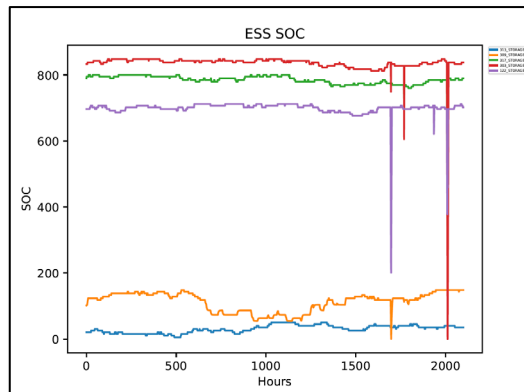

Figure: Distribution of Outages

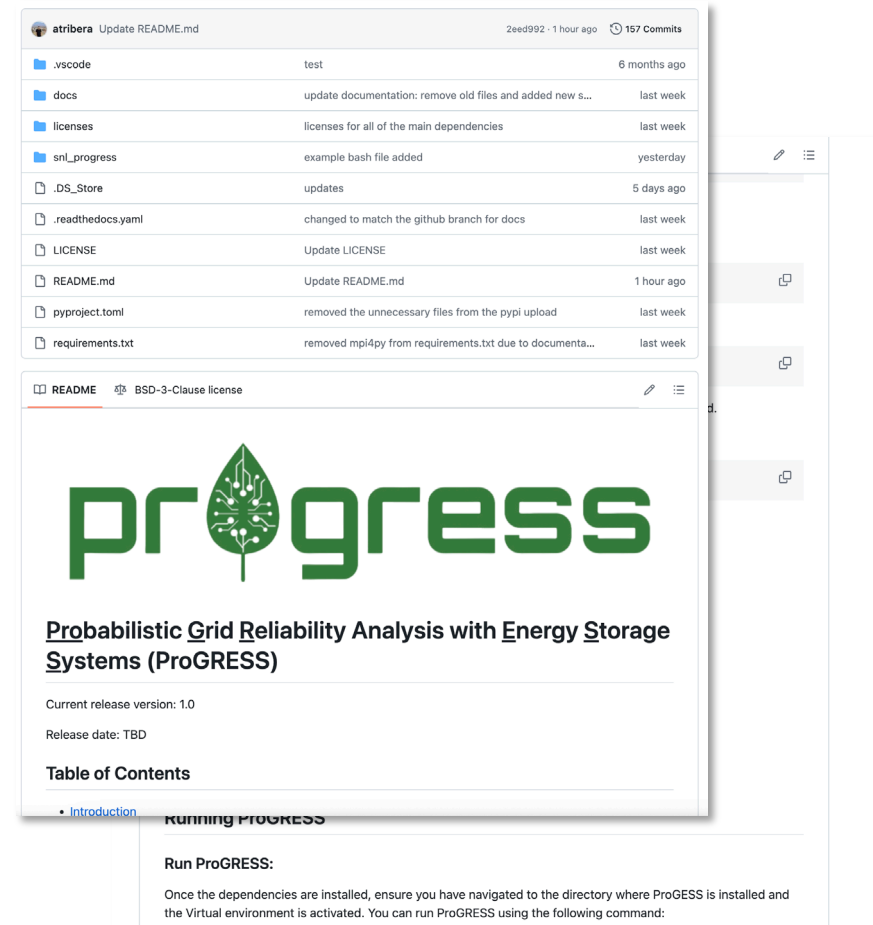

In-depth Analysis

DISTRIBUTION

Distribution & Documentation

- Available on GitHub
- Available via QuEST 2.0 platform
- Available on pypi, can be pip installed
- Executable version (.exe file) to be released soon
- Documentation available on GitHub, readthedocs.io

Read *the* Docs

Development Timeline and Future Work

FY23

- Code development started

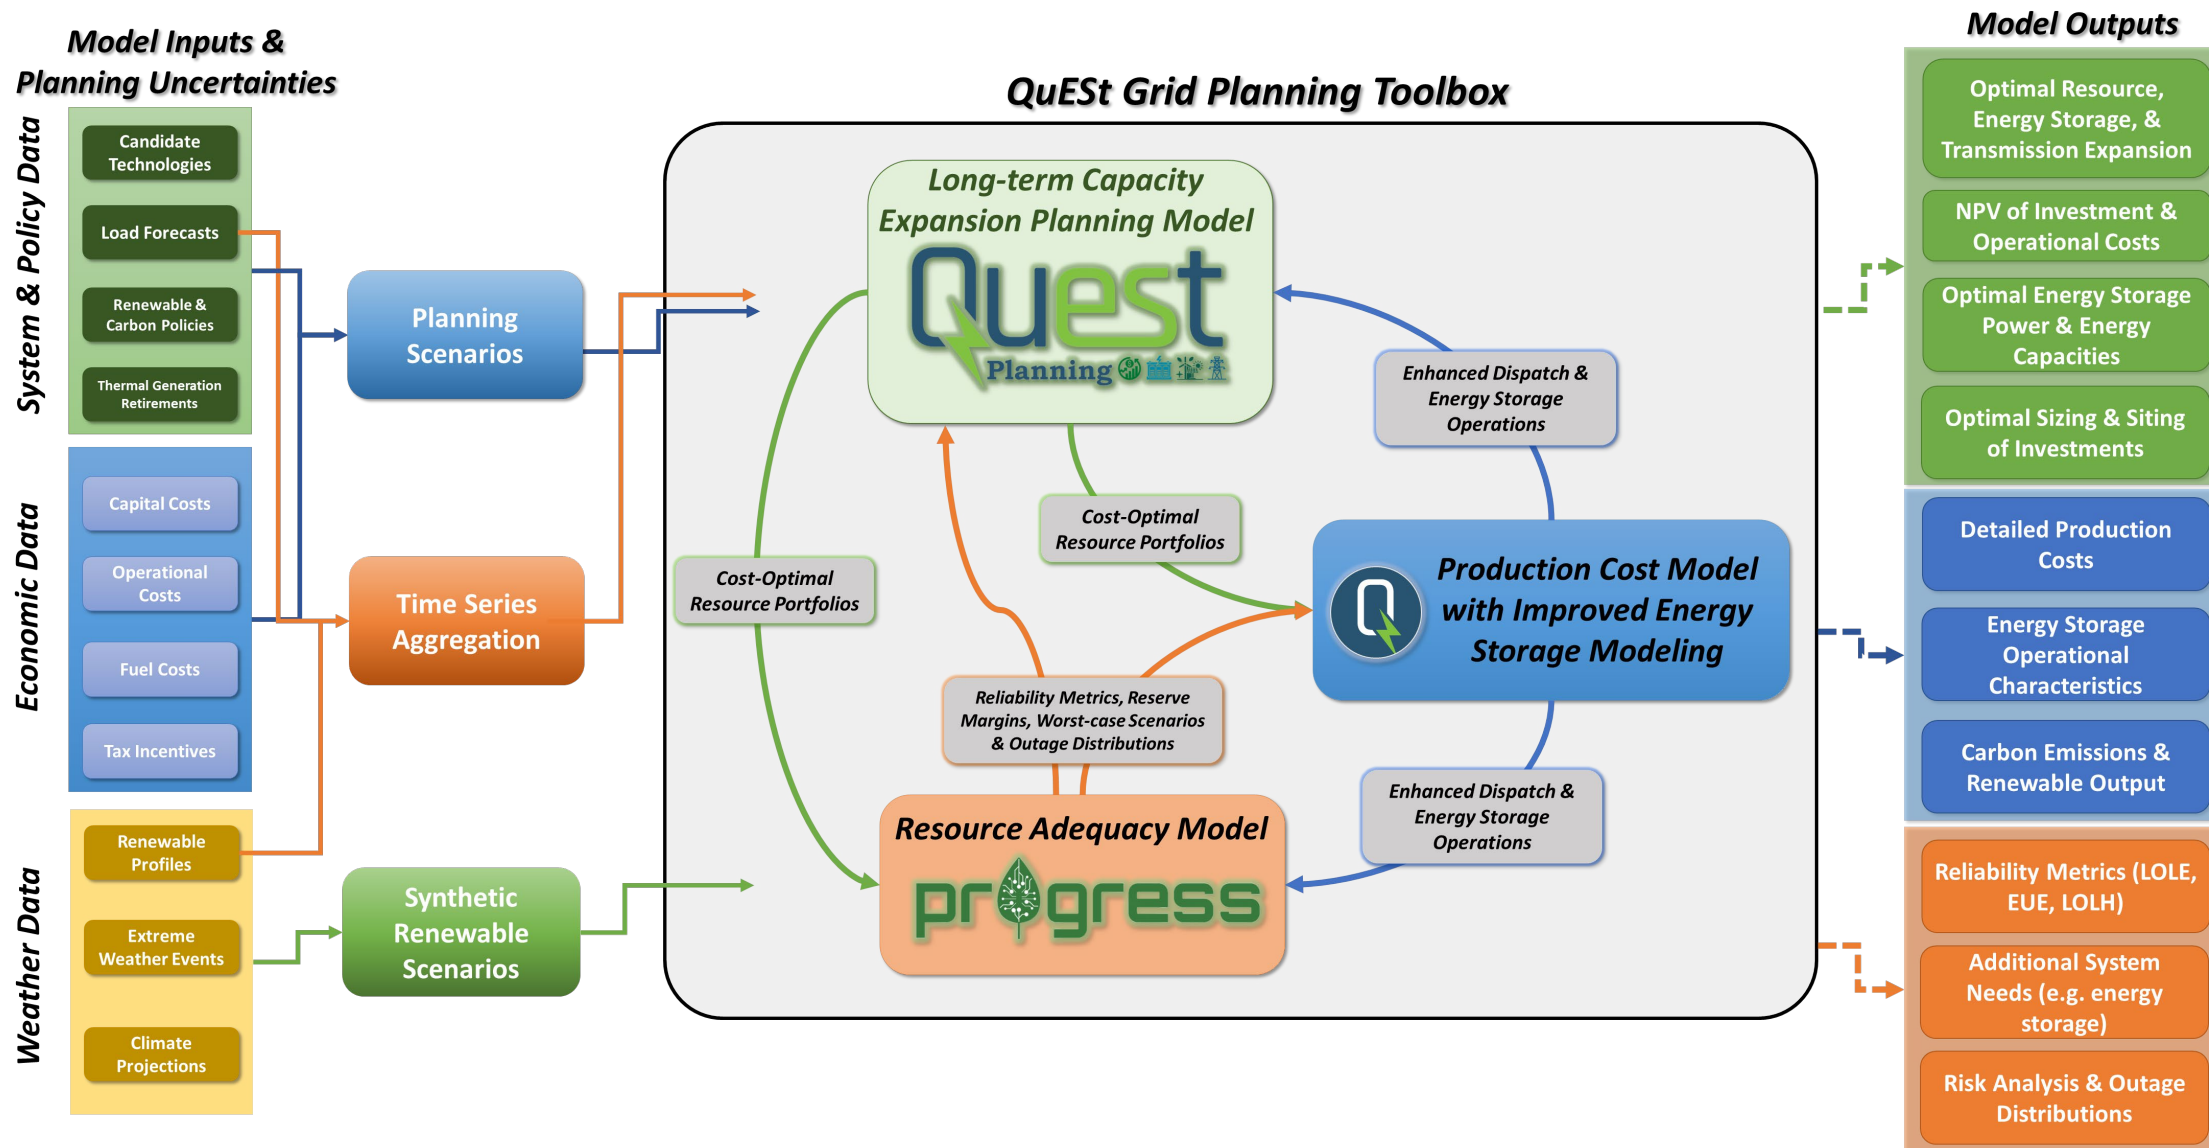

FY24

- Backend with stochastic MCS engine completed, GUI developed
- ESS multi-state failure model integrated
- Tool tested with Public Service Company of New Mexico (PNM) data
- **Accomplishments:** Release v1.0, paper at SPEEDAM 2024, EESAT 2024 abstract accepted, panel presentation at 2024 IEEE PES General Meeting, invited talk at IEEE P762 standards meeting

Future
Work

- Integrate models for valuation and sizing of ESS, including LDES, for reliability and resilience applications
- Enhanced ESS failure models—factors behind failure, optimize model with real-world data, new technologies
- Improve MCS engine for more efficient ESS ELCC calculations
- Advanced renewable energy scenario generation with data-driven Generative Adversarial Network—capture impact of extreme weather and extended black-sky conditions on LDES sizing

Grid Planning Tool Suite

Acknowledgment

- This material is based upon work supported by the U.S. Department of Energy, Office of Electricity (OE), Energy Storage Division.
- **Sandia National Laboratories:** Atri Bera (PI), Andres Lopez, Cody Newlun, Yung-Jai Pomeroy, Tu Nguyen (Lead, Energy Storage Analytics) and Ray Byrne (Manager, Energy Storage Technology and Systems)
